Abstract

Background: Coronavirus disease 2019 (COVID-19) is caused by coronavirus 2 (SARS-CoV-2). Symptoms include fever, cough, shortness of breath, muscle pain, pneumonia, and multi-organ failure. The infection spreads from one person to another via respiratory droplets. Alternative medicine (AMs) viz., Ayurveda, Homeopathy, Unani, and Traditional Chinese Medicine (TCM), are being promoted for the prevention of COVID-19. The aim of this systematic scoping review was to identify and summarize the scientific evidences promoting the use of AMs for the prevention of COVID-19.

Methods: A comprehensive search of electronic search engines (PubMed and Web of Science) was performed. In addition, freewheeling searches of the government health ministries and government websites was done to retrieve the available information. Records available until 12th March 2020 were considered. Reports proposing the use of AMs for prevention or treatment of COVID-19 across all countries were included. Screening (primary and secondary) of the records and data extraction from the eligible studies were done by a single reviewer followed by a random quality check (10%) by the second reviewer.

Results: Overall, 8 records (7 from China and 1 from India) exploring the use of AMs for the prevention or treatment of COVID-19 were identified. Different medicines were explored by different AM systems.

Conclusions: Several AMs options are proposed for the prevention or treatment of COVID-19. However, their efficacy and safety still needs scientific validation through rigorous randomized controlled trials. This review may help inform decisions about the importance of research and development of AMs for COVID-19 prevention and treatment.
Keywords: Alternative medicine, Ayurveda, COVID-19, Homeopathy, Traditional Chinese Medicine, Unani.
Introduction

Coronavirus disease 2019 (COVID-19) is spreading rapidly throughout the world and is infecting people irrespective of their age, sex and ethnicity. The healthcare systems of several countries are already stretched to their limits. The disease spreads via the respiratory droplets and close contact, and the disinfection of cities and communities is not showing to be effective for the control of the disease. The World Health Organization (WHO) has declared COVID-19 as a global pandemic which is causing critical challenges for the politicians, public health practitioners, scientists, and the medical community to deal with the situation. There is no specific antiviral treatment available in the modern medicine system to treat COVID-19. Despite concerted efforts, a truly effective vaccine is still not available. Under such conditions, it is imperative that resource-starved nations and communities may think for relatively cheaper options of alternative medicines (AMs) for prophylaxis or treat themselves against this virus. Presently, it is a worldwide emergency and the primary objective of mankind at this moment is to survive. The scientific basis of the AM treatment options can be explored and debated later. Mankind cannot allow thousands or millions to perish before modern medicine invents a cure or prophylaxis. In China itself, the total number of confirmed cases treated by Traditional Chinese Medicine (TCM) has reached 60,107. Indian government ministry of Ayurveda, Yoga & Naturopathy, Unani, Siddha and Homoeopathy (AYUSH) is also proposing Homeopathy and Ayurveda for prophylaxis and Unani medicines for symptomatic management of COVID-19.

There are two broad clinical systems for preventing or treating the disease i) modern medicine, which is experimental medicine based on modern scientific clinical evidence ii) alternative medicine, which comprises (a) Ayurveda: This system uses plant-based medicines with some
animal products as well as added minerals; the evidence is largely clinical. (b) Homeopathy: uses an extremely diluted form of numerous substances. Evidence is largely clinical and partly from randomized controlled trials (RCTs). (c) Unani is a Perso-Arabic system of medicine based originally on the teachings of the Greek physicians Hippocrates and Galen. (d) TCM: based on traditional practices and beliefs from China which mostly include herbal formulations besides acupuncture, cupping therapy, gua sha, massage (tui na), bonesetter (die-da), exercise (qigong), and dietary therapy. Recently, articles exploring the use of AMs for COVID-19 prevention or treatment are available in the electronic search engines such as PubMed, Web of Science, etc. This systematic scoping review aims to summarize available evidences on the AM options for the prevention or treatment of COVID-19. Specifically, we aimed to answer the following questions:

1. Is there any recent evidence available for using AMs for the prevention or treatment of COVID-19; if yes then how they are distributed country-wise?
2. Is there any scientific research-based evidence available for the proposed AMs for COVID-19 prevention or treatment?

Materials and Methods

Search criteria

A comprehensive literature search was performed following PRISMA guidelines⁶,⁷ to screen the records on AMs for COVID-19 (Figure 1 and Additional file S1) using the phrase (ayurveda OR traditional chinese medicine OR homeopathy OR unani OR siddha) AND (COVID-19). Briefly, electronic search engines (PubMed and Web of Science) were screened from the inception database to 12th of March 2020. In addition, freewheeling searches of the health ministry and government websites of different countries was done to retrieve all the relevant data. The records
issued by the government authorities reflect its acceptance among the society in that country and hence included. One reviewer (A.N.) screened all titles and abstracts and relevant full-text articles. A second researcher (V.S.) performed a quality check of a random selection of 10% of titles, abstracts, and full-text articles. Discrepancies were resolved; when a consensus was not reached, a third researcher was consulted. Relevant data from all included studies were extracted by a single reviewer, using a pre-defined extraction grid, which was subsequently validated by an independent reviewer. The detailed criteria of screening are mentioned on Additional file S1.

The inclusion and exclusion criteria are:

**Inclusion criteria**

(i) records where details of AMs (Ayurveda, Homeopathy, Unani, and TCM) on COVID-19 were given, are included for quantitative analysis (Additional file S2).

(ii) records whose abstract and full text available were included.

(iii) records published in English were included.

**Exclusion criteria**

(i) records where details on AMs were not available were excluded.

**Data extraction**

From the selected records following were extracted (i) type of AMs system i.e. Ayurveda, Homeopathy, Unani, and TCM (ii) country (iii) clinical treatment (iv) drug dosage recommended (v) drug duration recommended.

**Results**

A total of 8 records were obtained where the promotion of AMs (Ayurveda, Homeopathy, Unani, and TCM) for the prevention or treatment of COVID-19 were described (Additional file S2). Seven records were on TCM and one record covered Ayurveda, Homeopathy, and Unani.
medicines. Records were either from China (n=7) or India (n=1). Different AMs comprising preventive management and symptomatic management were proposed for the treatment of COVID-19. Diverse drug dose and duration were suggested for specific types of AMs (Table 1). During our search we found only the names of the Ayurvedic, Homeopathic, and Unani Medicines in the record. In order to understand the probable connection of these medicines with COVID-19, we further explored the general properties of promoted AMs whose details are:

**Ayurveda**

*Ark Ocimum sanctum (tulsi extract)*

It is said to prevent disease, promote general health, wellbeing and longevity. In addition to providing immunity, it is recommended as a treatment for a range of conditions including anxiety, fever, cough, asthma, diarrhea, vomiting, indigestion, dysentery, diabetes, arthritis, genitourinary disorders, and back pain.\(^{14-16}\)

*Amritarishta*

The main ingredient of Amritarishta is *Tinospora Cordifolia* and *Dashmool* with water. Dashmoolmatrabastiin has shown efficacy in the management of benign prostatic hyperplasia.\(^{17}\)

*Agastya Harityaki*

It contains Haritaki as one of the main components. The plant has been extensively used for cough, intermittent fevers, indigestion, anemia, asthma, neuropathy, etc. Haritaki has been well reported for its antiviral properties.\(^{18}\)

*SamshamaniVati*

It is an ayurvedic medicine used in the treatment of all types of fever. It is prepared with Giloya (*Tinospora cordifolia*).\(^{19}\) Giloya extract contains many constituents such as alkaloids, steroids, glycosides, and polysaccharides.\(^{20}\) Its extract is extensively used in various herbal preparations.
for the treatment of different ailments for its immunomodulatory, anti-inflammatory, anti-oxidant, anti-spasmodic, anti-osteoprotic, anti-arthritis, and anti-allergic properties.\textsuperscript{21,22}

*Trikatu (Pippali, Marich & Shunthi) powder and Tulsi leaves*

It is an herbal formulation containing dried fruits of *Piper nigrum* (Maricha) and *Piper longum* (Peepli), and dried rhizomes of *Zingiber officinale* (Sunthi) mixed together in equal quantities. Different extracts and fractions of Trikatu possess anti-oxidant,\textsuperscript{23} immunomodulatory,\textsuperscript{24,25} anti-allergic,\textsuperscript{26} and anti-arthritic\textsuperscript{27} activities. Studies report that Trikatu possesses the ability to improve the bioavailability of various drugs if combined with them thereby increasing the efficacy of the treatment. It is also prescribed for the treatment of asthma, cough, chronic rhinitis/sinusitis etc.\textsuperscript{28,29}

*Ashwagandha (Withania somnifera)*

It is also called 'Indian Ginseng', is an important medicinal plant widely used against many diseases in Indian Systems of Medicine. It is shown to possess anti-microbial, anti-inflammatory, anti-tumor, anti-stress, neuroprotective, cardioprotective, and anti-diabetic properties.\textsuperscript{30–32} It has shown antiviral activity against infectious bursal disease virus and herpes simplex virus type 1.\textsuperscript{33,34}

**Homeopathy**

*Arsenicum album 30C*

Arsenicum album 30C and two drops of sesame oil in each nostril each morning are suggested by the advisory given by Central Council for Research in Homeopathy (CCRH), India for prevention to COVID-19.\textsuperscript{5} Arsenicum album 30C is prepared by diluting aqueous arsenic trioxide until little or no arsenic remains, and is used in respiratory disorders. Mice intoxicated with arsenic trioxide injections when treated with Arsenicum album 30 showed revival and...
restoration of protein and DNA damage of liver and kidney. Some improvement in the clinical outcome of Acute Encephalitis Syndrome was observed with adjunctive Homeopathic medicines which included Arsenicum album 30.

**Unani**

*Sharbat Unnab*

It is widely used in the Unani system of medicine as a blood purifier, curing sore throat, catarrh, cough, urticaria, chest pain and pneumonia.

*Khamira Marwareed*

It exhibits immune-stimulatory activity leading to a Th1-dominant immune state. Although considered to be cardio-protective no scientific evidence is reported yet.

*Roghan Baboona*

It exhibits anti-inflammatory and analgesic activities. Massage with Roghan Baboona is reported to give relief from symptoms and signs of osteoarthritis and rheumatoid arthritis in patients.

*Arque-Ajeeb*

It is a Unani formulation consisting of plant extracts of *Menthaarvensis* Linn, seeds extract of *Trachyspermumammi* Linn and Camphor. It is reputed for its beneficial effects in the treatment of diarrhea and cholera, but the claim of the efficacy is yet to be tested.

*Habb-e-Ikseer Bukhar*

It is suggested as an antipyretic to lower the body temperature for clinical management of Dengue fever.

*Behidana*
The entire plant is used for medicinal purposes, and it has been proven as anti-oxidant, anti-bacterial, anti-inflammatory, anti-allergic, aphrodisiac, nephroprotective, anti-atherosclerotic, anti-hypertensive, hypolipidaemic, hepatoprotective, anti-spasmodic, and anti-cancerous. Sapistan

It exhibits significant anti-bacterial activity and is used to treat upper respiratory tract infections.

Darchini

It is also called Cinnamon, is a coagulant and prevents bleeding. It also possesses anti-microbial, anti-fungal, and anti-oxidant properties. Its use might be beneficial to reduce oxidative stress-induced complications and oxidative stress associated diseases.

Banafsha

It exhibits anti-inflammatory, anti-microbial, anti-oxidant, anti-pyretic, expectorant and anti-tussive, anti-spasm and bronchodilator, analgesic activities. Sharbatbanafsha also effectively relieves most of the complaints due to chronic sinusitis.

Chiraita

Previous research demonstrates that the Swertia chirayita extracts exhibit a wide range of biological activities, such as anti-bacterial, anti-fungal, anti-viral, anti-inflammatory, anti-diabetic and antioxidant.

Kasni

The root extract of Kasni (Cichoriumintybus) is shown to have anti-tumor and immunomodulatory properties. Dried root is used as a tonic in fevers, rheumatic complaints vomiting, diarrhea, and enlarged spleen.

Afsanteen
It exhibits diverse pharmacological effects such as anti-helminthic, anti-bacterial, anti-pyretic and hepatoprotective.\textsuperscript{59}

\textit{Neem Bark}

Its ingredients are used for the treatment of many cancers, infectious and metabolic diseases in traditional medicine.\textsuperscript{60}

\textit{Saad Koofi}

\textit{Saad Koofi (Cyperus rotundus)} is a medicinal plant having potential pharmacological actions both prophylactic and therapeutic.\textsuperscript{61}

\textit{Gule Surkh (Rosa damascene flower)}

It is medicinally used in various diseases such as asthma, bronchitis, wounds, and ulcer.\textsuperscript{62} The mixture made by rose and honey is very effective in throat problems.\textsuperscript{63}

\textbf{Traditional Chinese Medicine}

Mostly combinations of TCMs were proposed for the prevention or treatment of COVID-19 which are already covered by several articles\textsuperscript{4,5,8–10,12} Since the therapeutic activity was not of an individual medicine but of cocktail they are not described here. However, early intervention of TCMs showed to be effective in improving cure rate of COVID-19 patients. It delayed the disease progression, shortened the course of the disease and reduced mortality in the treated patients.\textsuperscript{4} Based on the effective response of TCM on COVID-19 patients, TCM treatment strategies have been included in guidelines issued from China.\textsuperscript{11,13} Further details of TCMs used for the treatment of COVID-19 are described in Table 1.

\textbf{Discussion}

The early cases of COVID-19 diseases were diagnosed in China in November 2019, which ultimately made a lockdown in a few regions of China in early 2020. Due to the unavailability of
definite modern medicines for the prevention or treatment of COVID-19, China along with other methods of prevention or treatment promoted and treated 60,107 Chinese people with TCM. The effective cure rate of QPD against COVID-19 was reported ~90%. In India, the promotion of AMs (Ayurveda, Homeopathy, and Unani) is underway.

The results of this study found that different medicines were proposed for the prevention or treatment of COVID-19 by different AM systems. All the proposals for promoting AMs were from China or India. TCMs were primarily promoted by China, whereas Ayurveda, Homeopathy, and Unani were promoted by India. Evidence from the screened records suggest that AMs were primarily considered as a preventive treatment of COVID-19 disease. The detailed mechanism of action of AMs on COVID-19 was not found in the studied records. We found that most of the medicines used were for the treatment of the symptoms (fever, cough, and chest related issues such as pneumonia, chest pain etc.) and boosting immunity. No RCT addressing the antiviral properties of these medicines against COVID-19 was observed. Robust evidence on the effect of these medicines on the COVID-19 life cycle and the infected individuals are lacking, and is required to understand their plausible role in the prevention or treatment of COVID-19.

Conclusions

This study limits to selective AM options i.e. Ayurveda, Homeopathy, Unani, and TCM, however other uncovered AMs such as naturopathy, etc. needs to be explored. Scientific lab research and RCTs are lacking for the proposed AMs for COVID-19. Screening for potential candidates via in silico analysis using the bioinformatics tool followed by in vitro screening of the proposed medicines and RCTs are needed for scientific justification. A detailed investigation
of the different combinations of these AMs is warranted to look if there is a definite solution to the COVID-19 disease. Studying other AMs for their efficacy to treat or prevent COVID-19, based on their known activities, would be an opportunity of window that could be explored. More information and research on AMs for COVID-19 treatment is needed from the different geographical locations of the World. This study may form an excellent foundation for developing lab research in the field of AMs and COVID-19, and draw the attention of scientists and researchers throughout the globe to study and understand the biological role of our listed AMs for the prevention and treatment of COVID-19. Following these suggestions, research conducted in this field may determine the importance and value of AMs and probable scope of a full systematic review.

Acknowledgments

The authors are thankful to Dr. Nirmal Chandra Asthana for his continuous support and suggestions on the manuscript. The grammar was checked by Grammarly software and the plagiarism from the online plagiarism checker ‘Duplichecker’ (https://www.duplichecker.com/).
