May 20, 2021

Abstract

Several collected data representing the spread of some infectious disease have demonstrated that the spread does not really exhibit homogeneous spread. Clear examples can include the spread of Spanish flu and Covid-19. Collected data depicting numbers of daily new infections in the case of Covid-19 from countries like Turkey, Spain show three waves with different spread patterns. A clear indication of crossover behaviors. While modelers have suggested many mathematical models to depicting these behaviors, it becomes clear that their mathematical models cannot really capture the crossover behaviors, especially passage from deterministic resetting to stochastics. Very recently Atangana and Seda have suggested a concept of piecewise modeling consisting in defining a differential operator piece-wisely, the idea was first in chaos and outstanding patterns were captured. In this paper, we extend this concept to the field of epidemiology with the aim to depict waves with different patterns. Due to the novelty of this concept, a different approach to insure the existence and uniqueness of system solutions are presented. A piecewise numerical approach is presented to derive numerical solutions of such models. An illustrative example is presented and compared with collected data from 3 different countries including Turkey, Spain and Czechia. The obtained results let no doubt for us to conclude that this concept is a new window that will help mankind to better understand nature.

Keywords: Piecewise modeling, piecewise existence and uniqueness, piecewise numerical scheme, Covid-19 model, fractional operators and stochastic approach.
1 Introduction

Although mankind has been using mathematical models to attempt replicating the spread patterns of infection diseases within given settlements, however in several cases, one will notice that their mathematical models do not always capture the wave and the different crossovers exhibiting by these waves. Some examples including the Spanish flu that started in 1918 and ended after three waves in 1920. Another recent one is the spread of Covid-19. The disagreement between experimental data and the solutions of mathematical equation is perhaps due to the fact that complexities of collected data are not sometimes taken into account. Another reason is perhaps the non-updating of existing theory, for example, many years the reproductive number have been used in many research papers with no new modification, indeed it is perhaps not worth to consider a reproductive number of a model describing spread that present three waves where each wave present a different pattern. Another example is the use of rates that have been always suggested to be constant, while a constant rate clearly show the homogeneity of the spread. Whereas in the normal situation rate of infection could be a function of time to indeed include into the mathematical equation the spread complexities or non-homogeneity. Another quit useful function to evaluate the stability of equilibrium point is the Lyapunov function. Such function cannot however inform about the wave and their patterns. Recorded data of Covid-19 spread of some countries show multiple waves. For example, collected data from Turkey, Czechia and Spain show three waves at least, where each wave present a different processes. Neither the concept of reproductive number or the Lyapunov function or the existing way of modeling epidemiological problems could possibly predict these waves. Indeed, modeling real world problems with crossover effects has always been a great challenge to modelers. Even though significant efforts have been made by researchers from different background, nevertheless there are still many real world problem exhibiting crossover behaviors with complex patterns. An effort made to address this resulted to an introduction of a fractional differential operators with non-singular kernel exhibiting a crossover from stretched exponential to power-law in terms of mean-square displacement. This non-singular kernel also has crossover from normal to sub-diffusion, also the kernel can express crossover from random walk to power-law. However, crossover from deterministic setting to stochastic or from stochastic to deterministic cannot be captured by this kernel, thus a great limitation of such operators to be used in this scenarios.

Very recently, Atangana and Seda suggested the concepts of piecewise differential and integral operators. Additionally, the extended their innovative idea to modeling by suggesting a piecewise modeling. This idea is perhaps the future of modeling with this innovative idea, we suggest in this paper a new way to model epidemiological problems exhibiting crossover behaviors. In this paper, two illustrative examples will be presented. We will assume that real world spread exhibit three waves with different patterns, classical, nonlocal and randomness, a permutation can be done to have different behaviors based on the above processes.
2 Modeling spread of infectious diseases with waves

In this section, we present a new way to model spread of infectious diseases exhibiting waves with different patterns. Let assume without loss of generality that a mathematical model with n classes describes spread of an infectious diseases with three waves where each wave exhibits different patterns, assume with no loss of generality that classical mechanical processes, non-local processes, randomness and their permutation, which will be considered in different cases.

2.1 Case 1: Classical-power-law-randomness

In this case, we assume a scenario where the three waves of the spread exhibit the above processes. We assume that the first process starts from 0 to \(T_1\), the second from \(T_1\) to \(T_2\), and the last from \(T_2\) to \(T\). A piecewise mathematical model associate to this can be given as

\[
\begin{align*}
\frac{dX_i}{dt} &= f(t, X), \text{ if } 0 \leq t \leq T_1 \\
X_i(0) &= X_{i,0}, i = 1, 2, ..., n \\
\frac{C_i}{T_1} D_t^\alpha X_i &= f(t, X), \text{ if } T_1 \leq t \leq T_2 \\
X_i(T_1) &= X_{i,1}, 0 < \alpha \leq 1, i = 1, 2, ..., n \\
dy(t) &= f(t, X) dt + \sigma_i X_i dB_i(t), \text{ if } T_2 \leq t \leq T \\
X_i(T_2) &= X_{i,2}, i = 1, 2, ..., n
\end{align*}
\]

where \(\sigma_i\) are densities of randomness and \(B_i\) are the functions of noise.

2.2 Case 2: Classical-Mittag–Leffler law-randomness

In this case, we assume a scenario where the three waves present processes with classical behaviors, passage from stretched exponential to power-law and randomness, within the intervals described earlier in case (1). A piecewise model associate to the above scenarios can be given as

\[
\begin{align*}
\frac{dX_i}{dt} &= f(t, X), \text{ if } 0 \leq t \leq T_1 \\
X_i(0) &= X_{i,0}, i = 1, 2, ..., n \\
\frac{\Gamma(\alpha)}{T_1} D_t^\alpha X_i &= f(t, X), \text{ if } T_1 \leq t \leq T_2 \\
X_i(T_1) &= X_{i,1}, 0 < \alpha \leq 1, i = 1, 2, ..., n \\
dy(t) &= f(t, X) dt + \sigma_i X_i dB_i(t), \text{ if } T_2 \leq t \leq T \\
X_i(T_2) &= X_{i,2}, i = 1, 2, ..., n
\end{align*}
\]

2.3 Case 3: Classical-fading memory-randomness

In this case, it is assumed that three waves are observed where the second wave displays fading memory process, which was known to be described best with the differential operator with exponential kernel. We also assume that three waves appear in the intervals described in case (1), then, the mathematical
model associate to this scenario is given as:

\[
\begin{aligned}
\frac{dX_i}{dt} &= f(t, X), \text{ if } 0 \leq t \leq T_1 \\
X_i(0) &= X_{i,0}, i = 1, 2, \ldots, n \\
\frac{C}{T_1}D^\alpha_t X_i &= f(t, X), \text{ if } T_1 \leq t \leq T_2 \\
X_i(T_1) &= X_{i,1}, 0 < \alpha \leq 1, i = 1, 2, \ldots, n \\
dy(t) &= f(t, X) dt + \sigma_i X_i dB_i(t), \text{ if } T_2 \leq t \leq T \\
X_i(T_2) &= X_{i,2}, i = 1, 2, \ldots, n
\end{aligned}
\]  

(3)

It is noted that in case (1), (2) and (3)

\[
\frac{C}{0} D^\alpha_t X_i = \frac{1}{\Gamma(1-\alpha)} \int_0^t (t-\tau)^{-\alpha} X_i'() d\tau, 0 < \alpha \leq 1,
\]  

(4)

\[
\frac{C}{0} D^\alpha_t X_i = \frac{M(\alpha)}{1-\alpha} \int_0^t X_i'() \exp \left( -\frac{\alpha}{1-\alpha} (t-\tau) \right) d\tau, 0 < \alpha \leq 1.
\]  

(5)

where \(M(\alpha)\) is the normalization function such that \(M(0) = M(1) = 1\). Also

\[
\frac{A}{0} D^\alpha_t X_i = \frac{AB(\alpha)}{1-\alpha} \int_a^t X_i'() E_\alpha \left( -\frac{\alpha}{1-\alpha} (t-\tau)^\alpha \right) d\tau, 0 < \alpha \leq 1
\]  

(6)

where \(AB(\alpha) = 1 - \alpha + \frac{\alpha}{\Gamma(\alpha)}\) is the normalization function such that \(AB(0) = AB(1) = 1\).

The analysis regarding the theory of existence and uniqueness will not be discussed here in general. However, this can be achieved within each interval. In our paper, we will present existence and uniqueness for some examples. But here, we shall present numerical solution of such model.

3 Numerical solution of piecewise epidemiological model

Assuming that the described models satisfy theoretical aspects of existence and uniqueness. Thus in this section, we present numerical solutions. We shall use in all cases based on the Newton polynomial interpolation.

3.1 Numerical method for Case 1:

We consider the first case

\[
\begin{aligned}
\frac{dX_i}{dt} &= f(t, X), \text{ if } 0 \leq t \leq T_1 \\
X_i(0) &= X_{i,0}, i = 1, 2, \ldots, n \\
\frac{C}{T_1}D^\alpha_t X_i &= f(t, X), \text{ if } T_1 \leq t \leq T_2 \\
X_i(T_1) &= X_{i,1}, \\
dy(t) &= f(t, X) dt + \sigma_i X_i dB_i(t), \text{ if } T_2 \leq t \leq T \\
X_i(T_2) &= X_{i,2}.
\end{aligned}
\]  

(7)
We divide [0, T] in three

\[ 0 \leq t_0 \leq t_1 \leq \ldots \leq t_{n_1} = T_1 \leq t_{n_1+1} \leq t_{n_1+2} \leq \ldots \leq t_{n_2} = T_2 \leq t_{n_2+1} \leq t_{n_2+2} \leq \ldots \leq t_{n_3} = T \quad (8) \]

The numerical solution can then be provided as

\[
\begin{align*}
X_i^{n_1} &= X_i (0) + \sum_{j_1=0}^{n_1} \left[ \frac{\Delta t}{12} f (t_{j_1}, X_j) - \frac{\alpha}{3} f (t_{j_1-1}, X_{j_1-1}) + \frac{\alpha}{12} f (t_{j_1-2}, X_{j_1-2}) \right] \Delta t, 0 \leq t \leq T_1 \\
X_i^{n_2} &= X_i (T_1) + \frac{\Delta t}{\Gamma (\alpha+1)} \sum_{j_2=n_1+1}^{n_2} f (t_{j_2}, X_{j_2}) \left\{ \frac{\alpha}{2} [(n_2 - j_2 + 1) - (n_2 - j_2)] \right\} \\
&+ \frac{\Delta t}{\Gamma (\alpha+2)} \sum_{j_2=n_1+3}^{n_2} f (t_{j_2}, X_{j_2}) \left\{ \frac{\alpha}{2} [(n_2 - j_2 + 1)^2 - (n_2 - j_2)] \right\} \\
&\times \left\{ \frac{\alpha}{2} [(n_2 - j_2 + 1) - (n_2 - j_2)] \right\} \Delta t, T_1 \leq t \leq T_2 \\
X_i^{n_3} &= X_i (T_2) + \sum_{j_3=n_2+3}^{n_3} \left[ \frac{\Delta t}{12} f (t_{j_3}, X_j) - \frac{\alpha}{3} f (t_{j_3-1}, X_{j_3-1}) + \frac{\alpha}{12} f (t_{j_3-2}, X_{j_3-2}) \right] \Delta t \\
&+ \sigma_i \sum_{j_3=0}^{n_3} X_j^{j_3} (B_i^{j_3} - B_i^{j_3-1}), T_2 \leq t \leq T. \quad (9)
\end{align*}
\]

### 3.2 Numerical method for Case 2:

We deal with the following problem with second case

\[
\begin{align*}
\frac{dx_i}{dt} &= f (t, X_i), \text{ if } 0 \leq t \leq T_1 \\
X_i (0) &= X_{i,0}, i = 1, 2, ..., n \\
\frac{d}{dt} \sum_{i=1}^{ABC} D_i^A X_i &= f (t, X), \text{ if } T_1 \leq t \leq T_2 \\
X_i(T_1) &= X_{i,1}, \\
dy (t) &= f (t, X) dt + \sigma_i X_i dB_i (t), \text{ if } T_2 \leq t \leq T \\
X_i (T_2) &= X_{i,2}. \quad (10)
\end{align*}
\]

The numerical solution for such problem is given by

\[
\begin{align*}
X_i^{n_1} &= X_i (0) + \sum_{j_1=0}^{n_1} \left[ \frac{\Delta t}{12} f (t_{j_1}, X_{j_1}) - \frac{\alpha}{3} f (t_{j_1-1}, X_{j_1-1}) + \frac{\alpha}{12} f (t_{j_1-2}, X_{j_1-2}) \right] \Delta t, 0 \leq t \leq T_1 \\
X_i^{n_2} &= X_i (T_1) + \frac{\alpha}{\Gamma (\alpha+2)} \sum_{j_2=n_1+1}^{n_2} f (t_{j_2}, X_{j_2}) \left\{ \frac{\alpha}{2} [(n_2 - j_2 + 1) - (n_2 - j_2)] \right\} \\
&+ \frac{\alpha}{\Gamma (\alpha+2)} \sum_{j_2=n_1+3}^{n_2} f (t_{j_2}, X_{j_2}) \left\{ \frac{\alpha}{2} [(n_2 - j_2 + 1)^2 - (n_2 - j_2)] \right\} \\
&\times \left\{ \frac{\alpha}{2} [(n_2 - j_2 + 1) - (n_2 - j_2)] \right\} \Delta t, T_1 \leq t \leq T_2 \\
X_i^{n_3} &= X_i (T_2) + \sum_{j_3=n_2+3}^{n_3} \left[ \frac{\Delta t}{12} f (t_{j_3}, X_{j_3}) - \frac{\alpha}{3} f (t_{j_3-1}, X_{j_3-1}) + \frac{\alpha}{12} f (t_{j_3-2}, X_{j_3-2}) \right] \Delta t \\
&+ \sigma_i \sum_{j_3=0}^{n_3} X_j^{j_3} (B_i^{j_3} - B_i^{j_3-1}), T_2 \leq t \leq T. \quad (11)
\end{align*}
\]
3.3 Numerical method for Case 3:

We consider the following problem with third case

\[
\begin{align*}
\frac{dx_i}{dt} &= f(t, X), \text{ if } 0 \leq t \leq T_1 \\
x_i(0) &= x_{i,0}, i = 1, 2, \ldots, n \\
ABCD_i = f(t, X), & \text{ if } T_1 \leq t \leq T_2 \\
x_i(T_1) &= x_{i,1}, \\
dy(t) &= f(t, X) dt + \sigma_i x_i dB_i(t), & \text{ if } T_2 \leq t \leq T \\
x_i(T_2) &= x_{i,2}.
\end{align*}
\]

Using same routine, the numerical solution can be obtained as

\[
X_i^{n_1} = x_i(0) + \sum_{j=1}^{n_1} \left[ \frac{\Delta t}{12} f(t_j, X_{j,1}) - \frac{1}{3} f(t_{j-1}, X_{j-1,1}) + \frac{5}{12} f(t_{j-2}, X_{j-2,1}) \right] \Delta t, 0 \leq t \leq T_1
\]

\[
X_i^{n_2} = x_i(T_1) + \frac{1-\alpha}{AB(\sigma)^2} f(t_{n_2}, X_{n_2}) + \frac{\alpha \Delta t}{AB(\sigma)^2} \sum_{j=n_2+1}^{n_3} f(t_{j-2}, X_{j-2,2}) \left\{ (n_2 - j_2 + 1)^\alpha - (n_2 - j_2)^\alpha \right\} \\
+ \frac{\alpha \Delta t}{2AB(\sigma)^2} \sum_{j=n_2+1}^{n_3} \left[ f(t_{j-1}, X_{j,1}) - f(t_{j-2}, X_{j-2,2}) \right] \left\{ (n_2 - j_2 + 1)^\alpha (n_2 - j_2 + 3 + 2\alpha) - (n_2 - j_2)^\alpha (n_2 - j_2 + 3 + 3\alpha) \right\} \\
+ \frac{\alpha \Delta t}{2AB(\sigma)^2} \sum_{j=n_2+1}^{n_3} \left[ f(t_{j-1}, X_{j,1}) - f(t_{j-2}, X_{j-2,2}) \right] \left\{ 2(n_2 - j_2)^2 + (3\alpha + 10)(n_2 - j_2) \right\} + 2\alpha^2 + 9\alpha + 12 \\
+ \frac{\alpha \Delta t}{2AB(\sigma)^2} \sum_{j=n_2+1}^{n_3} \left[ f(t_{j-1}, X_{j,1}) - f(t_{j-2}, X_{j-2,2}) \right] \left\{ 2(n_2 - j_2)^2 + (5\alpha + 10)(n_2 - j_2) \right\} + 6\alpha^2 + 18\alpha + 12 \right\}, T_1 \leq t \leq T_2
\]

\[
X_i^{n_3} = x_i(T_2) + \sum_{j=n_2+3}^{n_3} \left[ \frac{\Delta t}{12} f(t_j, X_{j,1}) - \frac{1}{3} f(t_{j-1}, X_{j-1,1}) + \frac{5}{12} f(t_{j-2}, X_{j-2,1}) \right] \Delta t \\
+ \sigma_i \sum_{j=n_2+3}^{n_3} X_j \left( B_i^j - B_i^{j-1} \right), T_2 \leq t \leq T.
\]

4 A mathematical model of Covid-19 spread with piecewise modeling

\[
\begin{align*}
\frac{dS}{dt} &= \Lambda - b(t) + b_{sq} Q - (b_{sq} + \lambda) S \\
\frac{dE}{dt} &= b(t) - (\beta + b_{eq} + \lambda) E \\
\frac{dI}{dt} &= \beta E - (\delta + \lambda + b_{ic}) I \\
\frac{dQ}{dt} &= b_{eq} S + b_{eq} E - (b_{qs} + b_{qe} + \lambda) Q \quad \text{if } 0 \leq t \leq T_1 \\
\frac{dC}{dt} &= b_{qe} Q + b_{ic} I - (\delta + b_{cr} + \lambda) C \\
\frac{dR}{dt} &= b_{cr} C - \lambda R \\
\frac{dW}{dt} &= k_1 E + k_2 I - \lambda_w W
\end{align*}
\]
\[ \begin{align*}
\frac{C}{T_1} D^t_s S &= \Lambda - b(t) + b_{qs} Q - (b_{sq} + \lambda) S \\
\frac{C}{T_1} D^t E &= b(t) - (\beta + b_{eq} + \lambda) E \\
\frac{C}{T_1} D^t I &= \beta E - (\delta + \lambda + b_{ic}) I \\
\frac{C}{T_1} D^t Q &= b_{sq} S + b_{eq} E - (b_{qs} + b_{qc} + \lambda) Q \quad \text{if } T_1 \leq t \leq T_2 \\
\frac{C}{T_1} D^t C &= b_{qc} Q + b_{ic} I - (\delta + b_{cr} + \lambda) C \\
\frac{C}{T_1} D^t R &= b_{cr} C - \lambda R \\
\frac{C}{T_1} D^t W &= k_1 E + k_2 I - \lambda_w W
\end{align*} \]

\[ \begin{align*}
dS &= (\Lambda - b(t) + b_{qs} Q - (b_{sq} + \lambda) S) \, dt + \sigma_1 S d\mathcal{B}_1(t) \\
dE &= (b(t) - (\beta + b_{eq} + \lambda) E) \, dt + \sigma_2 E d\mathcal{B}_2(t) \\
dI &= (\beta E - (\delta + \lambda + b_{ic}) I) \, dt + \sigma_3 I d\mathcal{B}_3(t) \\
dQ &= (b_{sq} S + b_{eq} E - (b_{qs} + b_{qc} + \lambda) Q) \, dt + \sigma_4 Q d\mathcal{B}_4(t) \quad \text{if } T_2 \leq t \leq T \\
dC &= (b_{qc} Q + b_{ic} I - (\delta + b_{cr} + \lambda) C) \, dt + \sigma_5 C d\mathcal{B}_5(t) \\
dR &= (b_{cr} C - \lambda R) \, dt + \sigma_6 R d\mathcal{B}_6(t) \\
dW &= (k_1 E + k_2 I - \lambda_w W) \, dt + \sigma_7 W d\mathcal{B}_7(t)
\end{align*} \]

where

\[ b(t) = \frac{\alpha_E}{1 + v_E} S E + \frac{\alpha_I}{1 + v_I} S I + \frac{\alpha_W}{1 + v_W} S W. \]  \hfill (14)

The function \( S(t) \) is the number of individuals susceptible to infection at a given time \( t \). The function \( E(t) \) is the number of individuals infected but not yet isolated at a given time \( t \). The function \( I(t) \) is the number of individuals isolated and expecting recovery at a given time \( t \). The function \( C(t) \) is the number of individuals certified to be infected with the virus, isolated and expecting recovery at a given time \( t \). The function \( R(t) \) is the number of individuals recovered at a given time \( t \). The function \( W(t) \) is the concentration of the virus in the environmental reservoir. The initial conditions

5 Existence and uniqueness of Covid-19 model

In this section, we attempt to present a proof of existence and uniqueness of system solution of this model. However, we shall note that, different techniques will be applied in respect to each interval, indeed for the first and second case, the well-known procedure using the Banach fixed-point theorem or modified versions will be applied, however, the last part, since concerning stochastic a different technique is applied.

\[
\begin{align*}
\frac{dS}{dt} &= \Lambda - b(t) + b_{qs}Q - (b_{sq} + \lambda)S \\
\frac{dE}{dt} &= b(t) - (\beta + b_{eq} + \lambda)E \\
\frac{dI}{dt} &= \beta E - (\delta + \lambda + b_{ic})I \\
\frac{dQ}{dt} &= b_{sq}S + b_{eq}E - (b_{qs} + b_{qc} + \lambda)Q \quad \text{if } 0 \leq t \leq T_1 \\
\frac{dC}{dt} &= b_{qs}Q + b_{ic}I - (\delta + b_{cr} + \lambda)C \\
\frac{dR}{dt} &= b_{cr}C - \lambda R \\
\frac{dW}{dt} &= k_1E + k_2I - \lambda_wW
\end{align*}
\]
where

$$\frac{d}{dt} X = f(X, t)$$

if $0 \leq t \leq T_1$

$$\frac{d}{dt} X = f(t, X)$$

if $T_1 \leq t \leq T_2$

$$\frac{d}{dt} X = f(X, t) dt + \sigma X dB(t)$$

if $T_2 \leq t \leq T$

We now present the existence and uniqueness of the piecewise model. For simplicity, we write subject to $X = (S, E, I, Q, C, R, W)$

$$\frac{d}{dt} X = f(X, t, \sigma, B(t), \tau_e)$$

where

$$f = (f_1, f_2, f_3, f_4, f_5, f_6, f_7), \sigma = (\sigma_1, \sigma_2, \sigma_3, \sigma_4, \sigma_5, \sigma_6, \sigma_7), B(t) = (B_1(t), B_2(t), B_3(t), B_4(t), B_5(t), B_6(t), B_7(t)).$$

To show the existence and uniqueness, we shall prove that $\forall \ [0, T_1]$ and $[T_1, T_2]$, $f_i(X, t)$ satisfy

1. Linear growth condition
2. The Lipschitz condition.

$\forall t \in [T_2, T]$ , another methodology will be adopted.

For proof, we consider $\forall t \in [T_2, T]$ .

Since all the used parameters of our model a positive constant, thus, they are continuous in Lipschitz sense for a given initial size of population $X(t) \in \mathbb{R}_+^7$, one can find a unique local solution. $X(t) \in [T_2, \tau_e)$, where $\tau_e$ denotes explosion time. To insure the solution is global, one has to prove that such system solution is global, we should prove that $\tau_e = \infty$. To achieve our goal, we consider $k_0 \in \mathbb{R}_+$ is a positive constant such that $X(T_2)$ lies within $[\frac{1}{k_0}, k_0]$. Additionally, we define a stopping time

$$\tau_k = \left\{ t \in [T_2, \tau_e] : \frac{1}{k} \geq \min \{X(t)\} \text{ or } \max \{X(t)\} \geq k \right\}$$

(18)
for each $k \geq k_0$.

$\tau_k$ is monotonically increasing as $k \to \infty$. $\lim_{k \to \infty} \tau_k = \tau_{\infty}$, with $\tau_{\infty} \geq \tau_{\infty}, \forall t \geq 0$, if we show that $\tau_{\infty} = 0$, then we can conclude that $\tau_e = \infty$ and $X(t) \in \mathbb{R}_+^n$ is solution. To achieve that we have to prove that $\tau_e = \infty$. Nevertheless if the conclusion is contradictory, then there exists $0 < T$ and $\xi \in (0, 1)$ such that

$$P \{ T \geq \tau_{\infty} \} > \xi. \tag{19}$$

We additionally define a function $\overline{\lambda} : \mathbb{R}_+^n \to \mathbb{R}_+$ in $\lambda \in C^2$ space such that

$$\overline{\lambda}(X(t)) = \sum_{i=1}^7 x_i - 7 - \sum_{i=1}^7 \log x_i. \tag{20}$$

Owning the fact that $\forall z > 0, z - 1 - \log z \geq 0$, this leads to $\overline{\lambda} \geq 0$. Additionally, it is assumed that $k_0 < k$ and $0 < T$, therefore a direct application of Ito formula leads to

$$d\overline{\lambda}(X) = \sum_{j=1}^7 \left( 1 - \frac{1}{x_j} \right) dx_j + \sigma_j (x_j - 1) dB_j(t) \tag{21}$$

Here

$$H(X) = \sum_{j=1}^7 \left( 1 - \frac{1}{x_j} \right) x'_j = \left( 1 - \frac{1}{S} \right) (\Lambda - b(t) + b_{qs} Q - (b_{sq} + \lambda) S)$$

$$+ \left( 1 - \frac{1}{E} \right) (b(t) - (\beta + b_{eq} + \lambda) E) + \left( 1 - \frac{1}{I} \right) (\beta E - (\delta + \lambda + b_{ic}) I)$$

$$+ \left( 1 - \frac{1}{Q} \right) (b_{sq} S + b_{eq} E - (b_{qs} + b_{qc} + \lambda) Q) + \left( 1 - \frac{1}{C} \right) (b_{qc} Q + b_{ic} I - (\delta + b_{cr} + \lambda) C)$$

$$+ \left( 1 - \frac{1}{R} \right) (b_{cr} C - \lambda R) + \left( 1 - \frac{1}{W} \right) (k_1 E + k_2 I - \lambda_W W) + \sum_{j=1}^7 \frac{\sigma_j^2}{2}. \tag{22}$$
Then

\[ H(X) = \Lambda + b_{sq}Q + \frac{b(t)}{S} + b_{sq} + \lambda + b(t) + \beta + b_{eq} + \lambda + \beta E + \delta \]

\[ + \lambda + b_{ic} + b_{sq}S + b_{eq}E + b_{qs} + b_{qc} + \lambda + b_{qc}Q + b_{ic}I \]

\[ + \delta + b_{cr} + \lambda + b_{cr}C + \lambda + k_1 E + k_2 I + \lambda_w \]

\[ \leq \left\{ \frac{\Lambda}{S} + b(t) + \frac{b_{sq}Q}{S} + (b_{sq} + \lambda) S + \frac{b(t)}{E} + (\beta + b_{eq} + \lambda) E \right\} \]

\[ + \frac{\beta E}{R} + (\delta + \lambda + b_{ic}) I + (b_{qs} + b_{qc} + \lambda) Q \]

\[ + \frac{b_{sq}S + b_{eq}E}{Q} + (\delta + b_{cr} + \lambda) C + \frac{b_{eq}Q + b_{ic}I}{C} + \lambda R \]

\[ + \frac{b_{cr}C}{R} + \lambda_w W + \frac{k_1 E + k_2 I}{W} \]

\[ < \Lambda + b_{sq} + 6\lambda + \beta + b_{eq} + \delta + b_{ic} + b_{qs} + b_{qc} + \delta + b_{cr} + \lambda_w = \bar{\phi} \]

and

\[ d\bar{X}(X) = \bar{\phi}dt + \sum_{j=1}^{7} \sigma_j (x_j - 1) dB_j (t). \]

By direct integration from 0 to \( \tau_k \wedge T \), we have

\[ E \left[ \bar{X}(\tau_k \wedge X) \right] \leq \bar{X}(X(T_2)) + E \left[ \int_0^{\tau_k \wedge T} \bar{\phi} \right] \]

\[ \leq \bar{X}(X(T_2)) + \bar{\phi}T. \]

Setting \( \Pi_k = \{ T > \tau_k \} \) for \( k \leq k \) and thus \( P(\Pi_k) \geq \xi \). Noting that for \( \forall \Omega \in \Pi_k \), there must exist at least one \( x(\tau_k, w) \) which is equal to \( \frac{1}{k} \) or \( k \). Then \( k - \log k - 1 \) or \( \frac{1}{k} + \log k - 1 \) as result

\[ \left( \log k + \frac{1}{k} - 1 \right) \wedge E(k - \log k - 1) < \bar{X}(X(\tau_k)). \]

From above, we can write

\[ \bar{X}(X(T_2)) + \bar{\phi}T > E(1_{\Pi_k} \bar{X}(X(\tau_k))) \]

\[ \geq \sigma \left( (k - \log k - 1) \wedge \left( \log k + \frac{1}{k} - 1 \right) \right) . \]

Here \( 1_{\Pi_k} \) is the indicator function of \( \Pi \). Thus \( \lim_{k \to \infty} \) leads

\[ \infty > \bar{X}(X(T_2)) + \bar{\phi}T = 0, \]

which is a contradiction. Therefore under the conditions presented earlier \( \tau_\infty = \infty \) which completes the proof. Within \( [0, T_2] \) we show that \( \forall [0, T_2], i = 1, 2, \ldots, 7 \)

\[ |f_i(x_i, t)|^2 \leq k_i \left( 1 + |x_i|^2 \right) \]

(29)
\[ |f_i(x_1, t) - f_i(x_2, t)|^2 \leq \bar{k}_i |x_1 - x_2|^2. \]  \hspace{1cm} (30)

For all \( t \in [0, T] \), we have
\[
\begin{align*}
|F_1(S, E, I, Q, C, R, W, t)|^2 &= |\Lambda - b(t) + b_{qs}Q - (b_{sq} + \lambda) S|^2 \\
&\leq 4 \left[ \Lambda^2 + |b(t)|^2 + b_{qs}^2 |Q|^2 + (b_{sq} + \lambda)^2 |S|^2 \right] \\
&\leq 4 \left[ \Lambda^2 + \sup_{0 \leq t \leq T} |b(t)|^2 + b_{qs}^2 \sup_{0 \leq t \leq T} |Q|^2 + (b_{sq} + \lambda)^2 |S|^2 \right] \\
&\leq 4 \left[ \Lambda^2 + 3\alpha_E^2 + 3\alpha_I^2 + 3\alpha_Q^2 + b_{qs}^2 \|Q\|_\infty + (b_{sq} + \lambda)^2 |S|^2 \right] \\
&\leq 4K \left( 1 + \frac{(b_{sq} + \lambda)^2}{K} |S|^2 \right) \\
&\leq k_1 \left( 1 + |S|^2 \right),
\end{align*}
\]  \hspace{1cm} (31)

where \( K = \left( \Lambda^2 + 3\alpha_E^2 + 3\alpha_I^2 + 3\alpha_Q^2 + b_{qs}^2 \|Q\|_\infty \right) \) and under the condition \( \frac{(b_{sq} + \lambda)^2}{K} < 1 \). For all \( t \in [0, T] \), we get
\[
\begin{align*}
|F_2(S, E, I, Q, C, R, W, t)|^2 &= |b(t) - (\beta + b_{eq} + \lambda) E|^2 \\
&\leq 2 |b(t)|^2 + 2 (\beta + b_{eq} + \lambda)^2 |E|^2 \\
&\leq 6 \left( \alpha_E^2 + \alpha_I^2 + \alpha_Q^2 \right) \sup_{0 \leq t \leq T} |S|^2 + 2 (\beta + b_{eq} + \lambda)^2 |E|^2 \\
&\leq 6 \left( \alpha_E^2 + \alpha_I^2 + \alpha_Q^2 \right) \|S\|_\infty^2 + 2 (\beta + b_{eq} + \lambda)^2 |E|^2 \\
&\leq 6 \left( \alpha_E^2 + \alpha_I^2 + \alpha_Q^2 \right) \|S\|_\infty^2 \left( 1 + \frac{2 (\beta + b_{eq} + \lambda)^2}{6 \left( \alpha_E^2 + \alpha_I^2 + \alpha_Q^2 \right) \|S\|_\infty^2} |E|^2 \right) \\
&\leq k_2 \left( 1 + |E|^2 \right)
\end{align*}
\]  \hspace{1cm} (32)
if \( \frac{2(\beta + b_{eq})^2}{\alpha_2^2 + \alpha_1^2 + \alpha_0^2} \| S^2 \|_{\infty} < 1 \),

\[
|F_3(S, E, I, Q, C, R, W, t)|^2 = |\beta E - (\delta + \lambda + b_{ic}) I|^2 \tag{33}
\]

\[
\leq 2\beta^2 |E|^2 + 2 (\delta + \lambda + b_{ic})^2 |I|^2
\]

\[
\leq 2\beta^2 \sup_{0 \leq t \leq T} |E|^2 + 2 (\delta + \lambda + b_{ic})^2 |I|^2
\]

\[
\leq 2\beta^2 \| E^2 \|_{\infty} + 2 (\delta + \lambda + b_{ic})^2 |I|^2
\]

\[
\leq 2\beta^2 \| E^2 \|_{\infty} \left(1 + \frac{2 (\delta + \lambda + b_{ic})^2}{2\beta^2 \| E^2 \|_{\infty}} |I|^2 \right)
\]

\[
\leq k_3 \left(1 + |I|^2 \right)
\]

if \( \frac{(\delta + \lambda + b_{ic})^2}{\beta^2 \| E^2 \|_{\infty}} < 1 \),

\[
|F_4(S, E, I, Q, C, R, W, t)|^2 = |b_{sq} S + b_{eq} E - (b_{qs} + b_{qc} + \lambda) Q|^2 \tag{34}
\]

\[
\leq 3 b_{sq}^2 \| S \|_{\infty}^2 + 3 b_{eq}^2 \| E \|_{\infty}^2 + 3 (b_{qs} + b_{qc} + \lambda)^2 |Q|^2
\]

\[
\leq 3 b_{sq}^2 \sup_{0 \leq t \leq T} |S|^2 + 3 b_{eq}^2 \sup_{0 \leq t \leq T} |E|^2 + 3 (b_{qs} + b_{qc} + \lambda)^2 |Q|^2
\]

\[
\leq 3 \left(b_{sq} \| S \|_{\infty} + b_{eq} \| E \|_{\infty} \right) \left(1 + \frac{3 (b_{qs} + b_{qc} + \lambda)}{3 b_{sq}^2 \| S \|_{\infty}^2 + b_{eq}^2 \| E \|_{\infty}^2} |Q|^2 \right)
\]

\[
\leq k_4 \left(1 + |Q|^2 \right)
\]

under the condition \( \frac{(b_{qs} + b_{qc} + \lambda)}{b_{sq}^2 \| S \|_{\infty}^2 + b_{eq}^2 \| E \|_{\infty}^2} < 1 \).

\[
|F_5(S, E, I, Q, C, R, W, t)|^2 = |b_{qc} Q + b_{ic} I - (\delta + b_{cr} + \lambda) C|^2 \tag{35}
\]

\[
\leq 3 b_{qc}^2 \| Q \|_{\infty}^2 + 3 b_{ic}^2 \| I \|_{\infty}^2 + 3 (\delta + b_{cr} + \lambda)^2 |C|^2
\]

\[
\leq 3 b_{qc}^2 \sup_{0 \leq t \leq T} |Q|^2 + 3 b_{ic}^2 \sup_{0 \leq t \leq T} |I|^2 + 3 (\delta + b_{cr} + \lambda)^2 |C|^2
\]

\[
\leq 3 \left(b_{qc} \| Q \|_{\infty}^2 + b_{ic} \| I \|_{\infty}^2 \right) \left(1 + \frac{3 (\delta + b_{cr} + \lambda)^2}{3 b_{qc}^2 \| Q \|_{\infty}^2 + 3 b_{ic}^2 \| I \|_{\infty}^2} |C|^2 \right)
\]

\[
\leq k_5 \left(1 + |C|^2 \right)
\]
if \( \frac{(\delta+b_{cr}+\lambda)^2}{k_r^2\|Q\|_\infty+b_{cr}^2|t|^2}_\infty < 1 \).

|F_6(S, E, I, Q, C, R, W, t)|^2 = |b_{cr}C - \lambda R|^2 \\
\leq 2k_r^2 |C|^2 + 2\lambda^2 |R|^2 \\
\leq 2k_r^2 \sup_{0 \leq t \leq T} |C|^2 + 2\lambda^2 |R|^2 \\
\leq 2k_r^2 \|C\|_\infty^2 + 2\lambda^2 |R|^2 \\
\leq 2k_r^2 \|C\|_\infty^2 \left(1 + \frac{2\lambda^2}{2k_r^2 \|C\|_\infty^2} |R|^2\right) \\
\leq k_6 \left(1 + |R|^2\right)

if \( \frac{k_2^2}{\|E\|_\infty^2 + k_2^2 \|I\|_\infty^2} < 1 \). Finally, we have

|F_7(S, E, I, Q, C, R, W, t)|^2 = |k_1 E + k_2 I - \lambda_w W|^2 \\
\leq 3k_1^2 |E|^2 + 3k_2^2 |I|^2 + 3\lambda_w^2 |W|^2 \\
\leq 3k_1^2 \sup_{0 \leq t \leq T} |E|^2 + 3k_2^2 \sup_{0 \leq t \leq T} |I|^2 + 3\lambda_w^2 |W|^2 \\
\leq 3k_1^2 \|E\|_\infty^2 + 3k_2^2 \|I\|_\infty^2 + 3\lambda_w^2 |W|^2 \\
\leq 3 \left(k_1^2 \|E\|_\infty^2 + k_2^2 \|I\|_\infty^2\right) \left(1 + \frac{3\lambda_w^2}{3k_1^2 \|E\|_\infty^2 + 3k_2^2 \|I\|_\infty^2} |W|^2\right) \\
\leq k_7 \left(1 + |W|^2\right)

under the condition \( \frac{k_2^2}{\|E\|_\infty^2 + k_2^2 \|I\|_\infty^2} < 1 \). To verify second condition, we write

|F_1(t, S_1) - F_1(t, S_2)|^2 \leq 2 \left(3\alpha_E^2 + 3\alpha_I^2 + 3\alpha_W^2 + (b_{sq} + \lambda)^2\right) |S_1 - S_2|^2 \\
\leq \bar{k}_1 |S_1 - S_2|^2 ,

|F_2(t, E_1) - F_2(t, E_2)|^2 \leq 2 \left(\alpha_E^2 |S|^2 + (b_{sq} + \lambda)^2\right) |E_1 - E_2|^2 \\
\leq 2 \left(\alpha_E^2 \sup_{0 \leq t \leq T} |S|^2 + (b_{sq} + \lambda)^2\right) |E_1 - E_2|^2 \\
\leq 2 \left(\alpha_E^2 \|S\|_\infty^2 + (b_{sq} + \lambda)^2\right) |E_1 - E_2|^2 \\
\leq \bar{k}_2 |S_1 - S_2|^2 ,

|F_3(t, I_1) - F_3(t, I_2)|^2 \leq (\delta + \lambda + b_{w})^2 |I_1 - I_2|^2 \\
\leq \bar{k}_3 |I_1 - I_2|^2 ,
\[ |F_4(t, Q_1) - F_4(t, Q_2)|^2 \leq (b_{qs} + b_{qc} + \lambda)^2 |Q_1 - Q_2|^2 \leq \bar{k}_4 |Q_1 - Q_2|^2, \]

\[ |F_5(t, C_1) - F_5(t, C_2)|^2 \leq (\delta + b_{cx} + \lambda)^2 |C_1 - C_2|^2 \leq \bar{k}_5 |C_1 - C_2|^2, \]

\[ |F_6(t, R_1) - F_6(t, R_2)|^2 \leq \lambda^2 |R_1 - R_2|^2 \leq \bar{k}_6 |R_1 - R_2|^2, \]

\[ |F_7(t, W_1) - F_7(t, W_2)|^2 \leq \lambda^2 |W_1 - W_2|^2 \leq \bar{k}_7 |W_1 - W_2|^2. \]

Therefore under the condition that

\[
\max \left\{ \frac{(b_{qs} + \lambda)^2}{K}, \frac{2(\beta + b_{qs} + \lambda)^2}{\sigma (\rho + \alpha + \alpha W^2)} \left\| \frac{\lambda^2}{\beta + b_{fs} + \lambda} \right\| \frac{(\delta + \lambda + b_{dc})^2}{\beta Q^2_{\infty} + b_{dc} |Q'|_{\infty}}, \frac{(b_{eq} + b_{qc} + \lambda)^2}{3 \lambda^2}, \frac{\partial^2}{\partial Q^2_{\infty} + b_{dc} |Q'|_{\infty}}, \frac{\partial^2}{\partial Q^2_{\infty} + b_{dc} |Q'|_{\infty}}, \frac{3 \lambda^2}{\beta Q^2_{\infty} + b_{dc} |Q'|_{\infty}} \right\} < 1. \]

Then assumed that the solution are positive in \([0, T_2]\), then \(\forall t \in [0, T]\) the piecewise has a unique positive solution.

6 Applications for Covid-19 model

A demonstrative example is better than precept, therefore, in this section, we present an application of the suggested theory. In particular, we will consider a mathematical model that was suggested to depicting the spread of Covid-19 within a given settlement. The model will be later modified to follow the steps presented in piece-wise modeling and for each model, a numerical method will be used to provide a numerical solution to the model. Numerical simulation using the suggested numerical are performed and depicted in Figure 1 to 7 for the first case, Figure 8 to 21 for second case and lastly Figure 22 to 28 for third case.

6.1 Numerical simulation of Covid-19 model for Case 1

In case one, we consider a country within which the spread displays three processes, including classical behaviors, power law behavior and finally stochastic behaviors. In this case, if we consider \(T\) as the last time of the spread, this is to say, the last day where a new infection occur, then, for the first period of time ranging from 0 to \(T_1\), the mathematical model will be constructed with classical differential operator, the second phrase, the model will be with the Caputo-Power law differential operator and
finally stochastic approach will be used at the last phase. The mathematical model explaining this
dynamic is then presented below.

\[
\begin{align*}
\frac{dS}{dt} &= \Lambda - b(t) + b_{qs}Q - (b_{eq} + \lambda) S \\
\frac{dE}{dt} &= b(t) - (\beta + b_{eq} + \lambda) E \\
\frac{dI}{dt} &= \beta E - (\delta + \lambda + b_{ic}) I \\
\frac{dQ}{dt} &= b_{qs}S + b_{eq}E - (b_{qs} + b_{qc} + \lambda) Q \\
\frac{dC}{dt} &= b_{eq}Q + b_{ic}I - (\delta + b_{cr} + \lambda) C \\
\frac{dR}{dt} &= b_{cr}C - \lambda R \\
\frac{dW}{dt} &= k_1E + k_2I - \lambda_wW
\end{align*}
\]

The initial conditions are considered as

\[
\begin{align*}
S (0) &= 1000, E (0) = 80, I (0) = 10, Q (0) = 10, C (0) = 20, R (0) = 10, W (0) = 10, \\
S (T_1) &= 405.2, S (T_2) = 302000, E (T_1) = 0.0000964, E (T_2) = 139, I (T_1) = 69.45, \\
I (T_2) &= 10990, Q (T_1) = 2.851, Q (T_2) = 2518, C (T_1) = 12.8, C (T_2) = 1543, \\
R (T_1) &= 11.76, R (T_2) = 7310, W (T_1) = 228.4, W (T_2) = 10390
\end{align*}
\]

and the parameters are

\[
\begin{align*}
\Lambda &= 0.0001, N = 1000, \alpha_E = 0.00003366, \alpha_I = 0.00006396, \alpha_W = 0.00001886, \\
b_{qs} &= 0.008667, b_{eq} = 0.000015, \kappa = 0.0066, \lambda = 0.0182, \beta = 0.5, \\
b_{ic} &= 0.00004103, b_{cr} = 0.0001333, k_1 = 0.01, k_2 = 0.235, \\
\lambda_w &= 0.01, \delta = 0.0382, b_{ic} = 0.00626, T_1 = 50, T_2 = 100, \sigma_1 = 0.08, \\
\sigma_2 &= 0.0094, \sigma_3 = 0.082, \sigma_4 = 0.078, \sigma_5 = 0.084, \sigma_6 = 0.079; \sigma_7 = 0.12.
\end{align*}
\]
The numerical simulations for piecewise model are performed in Figure 1-7.

Figure 1. Numerical visualization for susceptible people for $\alpha = 1$.

Figure 2. Numerical visualization for exposed people for $\alpha = 1$. 
Figure 3. Numerical visualization for infected people for $\alpha = 1$.

Figure 4. Numerical visualization for quarantined people for $\alpha = 1$. 
Figure 5. Numerical visualization for confirmed people for $\alpha = 1$.

Figure 6. Numerical visualization for recovered people for $\alpha = 1$. 
6.2 Numerical simulation of Covid-19 model for Case 2

In case two, we consider a given community where the spread displays three processes, including classical behaviors, fading memory behavior and finally stochastic behaviors. In this case, if we consider $T$ as the last time of the spread, this is to say, the last day where a new infection occurs, then, for the first period of time ranging from 0 to $T_1$, the mathematical model will be constructed with classical differential operator, the second phrase, the model will be with the Caputo-Fabrizio differential operator and finally stochastic approach will be used at the last phase. The mathematical model explaining this dynamic is then presented below.

\[
\begin{align*}
\frac{dS}{dt} &= \Lambda - b(t) + b_{qs}Q - (b_{sq} + \lambda)S \\
\frac{dE}{dt} &= b(t) - (\beta + b_{eq} + \lambda)E \\
\frac{dI}{dt} &= \beta E - (\delta + \lambda + b_{ic})I \\
\frac{dQ}{dt} &= b_{sq}S + b_{eq}E - (b_{qs} + b_{qc} + \lambda)Q \\
\frac{dC}{dt} &= b_{qc}Q + b_{ic}I - (\delta + b_{cr} + \lambda)C \\
\frac{dR}{dt} &= b_{cr}C - \lambda R \\
\frac{dW}{dt} &= k_1E + k_2I - \lambda_W W
\end{align*}
\]

\[
\begin{align*}
\frac{CF^{T_1}}{T_1}D^{\alpha}_t S &= \Lambda - b(t) + b_{qs}Q - (b_{sq} + \lambda)S \\
\frac{CF^{T_1}}{T_1}D^{\alpha}_t E &= b(t) - (\beta + b_{eq} + \lambda)E \\
\frac{CF^{T_1}}{T_1}D^{\alpha}_t I &= \beta E - (\delta + \lambda + b_{ic})I \\
\frac{CF^{T_1}}{T_1}D^{\alpha}_t Q &= b_{sq}S + b_{eq}E - (b_{qs} + b_{qc} + \lambda)Q \\
\frac{CF^{T_1}}{T_1}D^{\alpha}_t C &= b_{qc}Q + b_{ic}I - (\delta + b_{cr} + \lambda)C \\
\frac{CF^{T_1}}{T_1}D^{\alpha}_t R &= b_{cr}C - \lambda R \\
\frac{CF^{T_1}}{T_1}D^{\alpha}_t W &= k_1E + k_2I - \lambda_W W
\end{align*}
\]
\[
\begin{align*}
\frac{dS}{dt} &= (\Lambda - b(t) + b_{qs}Q - (b_{sq} + \lambda) S) dt + \sigma_1 S dB_1(t) \\
\frac{dE}{dt} &= (b(t) - (\beta + b_{eq} + \lambda) E) dt + \sigma_2 E dB_2(t) \\
\frac{dI}{dt} &= (\beta E - (\delta + \lambda + b_{ic}) I) dt + \sigma_3 I dB_3(t) \\
\frac{dQ}{dt} &= (b_{sq} S + b_{eq} E - (b_{qs} + b_{qc} + \lambda) Q) dt + \sigma_4 Q dB_4(t) \quad \text{if } T_2 \leq t \leq T. \\
\frac{dC}{dt} &= (b_{qc} Q + b_{ic} I - (\delta + b_{cr} + \lambda) C) dt + \sigma_5 C dB_5(t) \\
\frac{dR}{dt} &= (b_{cr} C - \lambda R) dt + \sigma_6 R dB_6(t) \\
\frac{dW}{dt} &= (k_1 E + k_2 I - \lambda_w W) dt + \sigma_7 W dB_7(t)
\end{align*}
\]

The initial conditions are as follows:

\[
\begin{align*}
S(0) &= 1000, E(0) = 20, I(0) = 0, Q(0) = 100, C(0) = 1, R(0) = 1, W(0) = 1, \quad (48) \\
S(T_1) &= 20100, S(T_2) = 596300, E(T_1) = 1994, E(T_2) = 32340, I(T_1) = 80.83, \\
I(T_2) &= 611.6, Q(T_1) = 7960, Q(T_2) = 120100, C(T_1) = 225, C(T_2) = 4419, \\
R(T_1) &= 437, R(T_2) = 13730, W(T_1) = 27.88, W(T_2) = 481.2
\end{align*}
\]

and the parameters are

\[
\begin{align*}
\Lambda &= 0.00022655, N = 1000, \alpha_E = 0.00003366, \alpha_I = 0.000006396, \\
\alpha_W &= 0.0001886, b_{qs} = 0.008667, b_{sq} = 0.000015, \kappa = 0.0066, \\
\lambda &= 0.0182, \beta = 0.1, b_{eq} = 0.000004103, b_{qc} = 0.1333, \\
b_{cr} &= 1/15, k_1 = 0.01, k_2 = 0.0235, \lambda_w = 1, \delta = 3.82, b_{ic} = 0.626, \quad (50) \\
T_1 &= 25, T_2 = 60, \sigma_1 = 0.08, \sigma_2 = 0.0094, \sigma_3 = 0.082, \\

6.3 Numerical solution of Covid-19 model for Case 3:

In case three, assuming a given country within which the spread displays three processes, including classical behaviors, a passage from stretched exponential to power law behavior and finally stochastic behaviors. In this case, if we consider $T$ as the last time of the spread, this is to say, the last day where a new infection occurs, then, for the first period of time ranging from 0 to $T_1$, the mathematical model will be constructed with classical differential operator, the second phrase, the model will be with the Atangana-Baleanu fractional differential operator and finally stochastic approach will be used at the last phase. The mathematical model explaining this dynamic is then presented below.

\[
\begin{align*}
    \frac{dS}{dt} &= \Lambda - b(t) + b_{sq}Q - (b_{sq} + \lambda)S \\
    \frac{dE}{dt} &= b(t) - \left(\beta + b_{cq} + \lambda\right)E \\
    \frac{dI}{dt} &= \beta E - \left(\delta + \lambda + b_{ic}\right)I \\
    \frac{dQ}{dt} &= b_{sq}S + b_{eq}E - \left(b_{sq} + b_{eq} + \lambda\right)Q \quad \text{if } 0 \leq t \leq T_1 \\
    \frac{dC}{dt} &= b_{qc}Q + b_{ic}I - \left(\delta + b_{cr} + \lambda\right)C \\
    \frac{dR}{dt} &= b_{cr}C - \lambda R \\
    \frac{dW}{dt} &= k_1E + k_2I - \lambda_wW
\end{align*}
\]
In Figure 22-28, the numerical simulations of model with piecewise derivative are depicted with

\[
\begin{align*}
&dS = (\Lambda - b(t) + b_{qs}Q - (b_{sq} + \lambda)S)dt + \sigma_1SdB_1(t) \\
&dE = (b(t) - (\beta + b_{eq} + \lambda)E)dt + \sigma_2EdB_2(t) \\
&dI = (\beta E - (\delta + \lambda + b_{ic})I)dt + \sigma_3IdB_3(t) \\
&dQ = (b_{qs}S + b_{eq}E - (b_{sq} + b_{qc} + \lambda)Q)dt + \sigma_4QdB_4(t) \quad \text{if } T_1 \leq t \leq T_2 \\
&dC = (b_{qc}Q + b_{ic}I - (\delta + b_{cr} + \lambda)C)dt + \sigma_5CdB_5(t) \\
&dR = (b_{cr}C - \lambda R)dt + \sigma_6RdB_6(t) \\
&dW = (k_1E + k_2I - \lambda_w W)dt + \sigma_7WdB_7(t)
\end{align*}
\]

\[
\begin{align*}
&\frac{d}{dt}S = \frac{\Lambda}{T_2} - \frac{b(t)}{T_2} + \frac{b_{qs}Q}{T_2} - \frac{(b_{sq} + \lambda)S}{T_2} \\
&\frac{d}{dt}E = \frac{b(t)}{T_2} - \frac{(\beta + b_{eq} + \lambda)E}{T_2} \\
&\frac{d}{dt}I = \frac{\beta E}{T_2} - \frac{(\delta + \lambda + b_{ic})I}{T_2} \\
&\frac{d}{dt}Q = \frac{b_{qs}S}{T_2} + \frac{b_{eq}E}{T_2} - \frac{(b_{sq} + b_{qc} + \lambda)Q}{T_2} \quad \text{if } T_2 \leq t \leq T. \\
&\frac{d}{dt}C = \frac{b_{qc}Q}{T_2} + \frac{b_{ic}I}{T_2} - \frac{(\delta + b_{cr} + \lambda)C}{T_2} \\
&\frac{d}{dt}R = \frac{b_{cr}C}{T_2} - \frac{\lambda R}{T_2} \\
&\frac{d}{dt}W = \frac{k_1E}{T_2} + \frac{k_2I}{T_2} - \frac{\lambda_w W}{T_2}
\end{align*}
\]

In Figure 22-28, the numerical simulations of model with piecewise derivative are depicted with

\[
\begin{align*}
S(0) &= 10000, E(0) = 1, I(0) = 0, Q(0) = 0, C(0) = 1, R(0) = 1, W(0) = 1, \quad (53) \\
S(T_1) &= 2022 \times 10^3, S(T_2) = 1654 \times 10^3, E(T_1) = 1531, E(T_2) = 21840, \\

7 Comparison between piecewise model and real data for some countries

7.1 Comparison between a piecewise model and real data in Turkey

In this subsection, we compare modified model by using model that we introduced in the previous chapters with daily number of cases between March 11 and April 20, 2021 in Turkey. Since it will not be easy to predict such long time interval data, to achieve greater compatibility between model that we will suggest and data, we will write our model in more pieces. In other words, although we presented our model in 3 pieces in the previous chapters, of course, we should know that we can write the model in more pieces in order to capture more reality in modeling daily problems. Thus, it will be inevitable for us to achieve our goal. But since this situation brings much more complexity with it, that’s why let us first present some notations to avoid this complexity. We will use the notation $X_i$, $i = 1, 2, ..., 7$ such that

$$X_1 = S, X_2 = E, X_3 = I, X_4 = Q, X_5 = C, X_6 = R, X_7 = W$$

and

Figure 28. Numerical visualization for concentration of the virus for $\alpha = 0.95$. 

CC-BY-NC-ND 4.0 International license
It is made available under a CC-BY-NC-ND 4.0 International license.
\[ f_1 (t, X_i) = \Lambda - b(t) + b_{qs} Q - (b_{sq} + \lambda) S \]
\[ f_2 (t, X_i) = b(t) - (\beta + b_{eq} + \lambda) E \]
\[ f_3 (t, X_i) = \beta E - (\delta + \lambda + b_{ie}) I \]
\[ f_4 (t, X_i) = b_{sq} S + b_{eq} E - (b_{qs} + b_{qc} + \lambda) Q \]
\[ f_5 (t, X_i) = b_{qc} Q + b_{ie} I - (\delta + b_{cr} + \lambda) C \]
\[ f_6 (t, X_i) = b_{cr} C - \lambda R \]
\[ f_7 (t, X_i) = k_1 E + k_2 I - \lambda W. \]

To do comparison, considering above notations, we construct the following model piecewisely

\[
\begin{cases}
\frac{dX_i}{dt} = f_i (t, X_i), & \text{if } 0 \leq t \leq T_1 \\
X_i (0) = X_{i,0}, & i = 1, 2, \ldots, 7 \\
dX_i (t) = f_t (t, X_i) \, dt + \sigma_j X_i dB_j (t), & \text{if } T_1 \leq t \leq T_2 \\
X_i (T_1) = X_{i,1}, & i = 1, 2, \ldots, 7 \\
\frac{dX_i}{dt} = f_i (t, X_i), & \text{if } T_2 \leq t \leq T_3 \\
X_i (T_2) = X_{i,2}, & i = 1, 2, \ldots, 7 \\
dX_i (t) = f_t (t, X_i) \, dt + \sigma_j X_i dB_j (t), & \text{if } T_3 \leq t \leq T_4 \\
X_i (T_3) = X_{i,3}, & i = 1, 2, \ldots, 7 \\
\frac{dX_i}{dt} = f_i (t, X_i), & \text{if } T_4 \leq t \leq T_5 \\
X_i (T_4) = X_{i,4}, & i = 1, 2, \ldots, 7 \\
\frac{dX_i}{dt} = f_t (t, X_i) \, dt + \sigma_k X_i dB_k (t), & \text{if } T_5 \leq t \leq T \\
X_i (T_5) = X_{i,5}, & i = 1, 2, \ldots, 7 \\
\end{cases}
\] (57)

We shall present the parameters and initial conditions that we used for comparison in Turkey. Initial conditions are considered as

\[
\begin{align*}
X_1 (0) & = 83000000, X_2 (0) = 1200, X_3 (0) = 1, X_4 (0) = 1, X_5 (0) = 1, X_6 (0) = 1, X_7 (0) = 1. \quad (58) \\
X_1 (T_1) & = 134 \times 10^6, X_1 (T_2) = 3312 \times 10^6, X_1 (T_3) = 2612 \times 10^6, X_1 (T_4) = 1502 \times 10^6, X_1 (T_5) = 788 \times 10^6, \\
X_2 (T_1) & = 52180, X_2 (T_2) = 337600, X_2 (T_3) = 818800, \\
X_2 (T_4) & = 336300, X_2 (T_5) = 191000, X_3 (T_1) = 95, X_3 (T_2) = 2167, X_3 (T_3) = 1300, \\
X_3 (T_4) & = 1900, X_3 (T_5) = 9174, X_4 (T_1) = 1706 \times 10^5, X_4 (T_2) = 4565 \times 10^5, \\
X_4 (T_3) & = 3619 \times 10^7, X_4 (T_4) = 217 \times 10^7, X_4 (T_5) = 1113 \times 10^6, X_5 (T_1) = 4168000, \\
X_5 (T_2) & = 1623 \times 10^5, X_5 (T_3) = 9611 \times 10^5, X_5 (T_4) = 6008 \times 10^4, X_5 (T_5) = 2976 \times 10^4, \\
X_6 (T_1) & = 4899 \times 10^3, X_6 (T_2) = 5018 \times 10^5, X_6 (T_3) = 1019 \times 10^7, X_6 (T_4) = 8747 \times 10^5, \\
X_6 (T_5) & = 2624 \times 10^5, X_7 (T_1) = 5140, X_7 (T_2) = 155400, X_7 (T_3) = 1722 \times 10^3, \\
X_7 (T_4) & = 35510, X_7 (T_5) = 119200
\end{align*}
\]
and the parameters are

\[ \Lambda = 84000000, N = 83000000, \alpha_E = 0.3366, \alpha_I = 0.6396, \alpha_W = 0.1886, b_{qs} = 0.8667, \]
\[ b_{sq} = 0.015, \kappa = 1.66, \lambda = 0.0182, \beta = 0.014, b_{eq} = 0.34103, \delta = 4.82, b_{qc} = 0.00626, \]
\[ b_{qc} = 0.1333, b_{cr} = \frac{1}{5}, k_1 = 0.01, k_2 = 0.0235, \lambda_w = 0.011, T_1 = 15, T_2 = 60, T_3 = 258, \]
\[ T_4 = 285, T_5 = 382, \sigma_1 = \sigma_8 = \sigma_{15} = 0.008, \sigma_{17} = 0.05, \sigma_2 = \sigma_9 = \sigma_{16} = 0.0094, \]
\[ \sigma_3 = 0.2, \sigma_{10} = 0.07, \sigma_4 = \sigma_{11} = \sigma_{18} = 0.0078, \sigma_5 = \sigma_{12} = \sigma_{19} = 0.0084, \]
\[ \sigma_6 = \sigma_{13} = \sigma_{20} = 0.0079; \sigma_7 = \sigma_{14} = \sigma_{21} = 0.0012. \]

The simulations for comparison are performed using above initial data and parameters in Figure 29 and 30.

**Figure 29.** Comparison between piecewise model and real data in Turkey for \( \alpha = 0.98 \).
7.2 Comparison between piecewise model and real data in Czechia

In this subsection, we compare the daily number of cases between 2 March and 20 April 2021 in Czech Republic with model that will be presented here to analyze the concept we have introduced and to display different processes. Thus, we present the following model which composed of 7 pieces

\[
\begin{align*}
\text{Case 1:} & \quad \frac{dX_i}{dt} = f_i(t, X_i), \text{ if } 0 \leq t \leq T_1 \\
X_i(0) &= X_{i,0}, i = 1, 2, \ldots, 7 \\
\text{Case 2:} & \quad \frac{dX_i}{dt} = f(t, X_i) dt + \sigma_1 X_i dB_i(t), \text{ if } T_1 \leq t \leq T_2 \\
X_i(T_1) &= X_{i,1}, i = 1, 2, \ldots, 7 \\
\text{Case 3:} & \quad \frac{dX_i}{dt} = -f(t, X_i) dt + \sigma_j X_i dB_j(t), \text{ if } T_2 \leq t \leq T_3 \\
X_i(T_2) &= X_{i,2}, j = 8, 9, \ldots, 14 \\
\text{Case 4:} & \quad C^F \int_0^t X_i(t) = f(t, X_i) dt + \sigma_k X_i dB_k(t), \text{ if } T_3 \leq t \leq T_4 \\
X_i(T_3) &= X_{i,3}, k = 15, 16, \ldots, 21 \\
\text{Case 5:} & \quad \frac{dX_i}{dt} = -f(t, X_i) dt + \sigma_l X_i dB_l(t), \text{ if } T_4 \leq t \leq T_5 \\
X_i(T_4) &= X_{i,4}, l = 21, 22, \ldots, 28 \\
\text{Case 6:} & \quad \frac{dX_i}{dt} = f(t, X_i) dt + \sigma_m X_i dB_m(t), \text{ if } T_5 \leq t \leq T_6 \\
X_i(T_5) &= X_{i,5}, m = 29, 30, \ldots, 35 \\
\text{Case 7:} & \quad \frac{dX_i}{dt} = -f(t, X_i) dt + \sigma_n X_i dB_n(t), \text{ if } T_6 \leq t \leq T \\
X_i(T_6) &= X_{i,6}, n = 36, 37, \ldots, 42
\end{align*}
\]

The parameters and initial conditions that we used for comparison in Czechia are given as...
\[
X_1(0) = 10600000, X_2(0) = 2000, X_3(0) = 1, X_4(0) = 1, X_5(0) = 1, X_6(0) = 1, X_7(0) = 1612
\]

\[
X_1(T_1) = 5614 \times 10^6, X_1(T_2) = 5384 \times 10^8, X_1(T_3) = 4087 \times 10^7, X_1(T_4) = 5244 \times 10^8,
\]

\[
X_1(T_5) = 4187 \times 10^7, X_1(T_6) = 6752 \times 10^7, X_2(T_1) = 57300, X_2(T_2) = 1682000,
\]

\[
X_2(T_3) = 37220, X_2(T_4) = 1761000, X_2(T_5) = 42350, X_2(T_6) = 1726000, X_3(T_1) = 321.4,
\]

\[
X_3(T_2) = 7230, X_3(T_3) = 6920, X_3(T_4) = 8449, X_3(T_5) = 7221, X_3(T_6) = 8995,
\]

\[
X_4(T_1) = 827 \times 10^5, X_4(T_2) = 7956 \times 10^6, X_4(T_3) = 5821 \times 10^5, X_4(T_4) = 217 \times 10^7,
\]

\[
X_4(T_5) = 8856 \times 10^6, X_4(T_6) = 1116 \times 10^7, X_5(T_1) = 4420000, X_5(T_2) = 2134 \times 10^5,
\]

\[
X_5(T_3) = 1851 \times 10^4, X_5(T_4) = 2597 \times 10^5, X_5(T_5) = 2757 \times 10^4, X_5(T_6) = 2687 \times 10^5,
\]

\[
X_6(T_1) = 2324 \times 10^4, X_6(T_2) = 1197 \times 10^6, X_6(T_3) = 5895 \times 10^5, X_6(T_4) = 192 \times 10^6,
\]

\[
X_6(T_5) = 8069 \times 10^5, X_6(T_6) = 2571 \times 10^5, X_7(T_1) = 663200, X_7(T_2) = 3443000,
\]

\[
X_7(T_3) = 881600, X_7(T_4) = 4649000, X_7(T_5) = 1239000, X_7(T_6) = 5843000,
\]

and

\[
\Lambda = 10600000, N = 10600000, \alpha_E = 0.3366, \alpha_I = 0.6396, \alpha_W = 0.1886, b_{qs} = 0.8667, \quad (63)
\]

\[
b_{sq} = 0.015, \quad \kappa = 1.06, \quad \lambda = 0.0182, \quad \beta = 0.027, \quad b_{eq} = 0.34103, \quad \delta = 4.82, \quad b_{rc} = 0.00626,
\]

\[
b_{qc} = 0.1333, \quad b_{cr} = 1/5, \quad k_1 = 0.01, \quad k_2 = 0.0235, \quad \lambda_w = 0.011, \quad T_1 = 205, \quad T_2 = 245, \quad T_3 = 280,
\]

\[
T_4 = 315, \quad T_5 = 349, \quad T_6 = 385, \quad \sigma_1 = \sigma_8 = \sigma_3 = \sigma_{15} = \sigma_{22} = \sigma_{29} = \sigma_{36} = 0.008,
\]

\[
\sigma_2 = \sigma_9 = \sigma_{16} = \sigma_{23} = \sigma_{30} = \sigma_{37} = 0.0094, \quad \sigma_3 = \sigma_{17} = \sigma_{31} = 0.25, \quad \sigma_{10} = \sigma_{24} = \sigma_{38} = 0.15,
\]

\[
\sigma_4 = \sigma_{11} = \sigma_{18} = \sigma_{25} = \sigma_{32} = \sigma_{39} = 0.0078, \quad \sigma_5 = \sigma_{12} = \sigma_{19} = \sigma_{26} = \sigma_{33} = \sigma_{40} = 0.0084,
\]

\[
\sigma_6 = \sigma_{13} = \sigma_{20} = \sigma_{27} = \sigma_{34} = \sigma_{41} = 0.0079; \quad \sigma_7 = \sigma_{14} = \sigma_{21} = \sigma_{28} = \sigma_{35} = \sigma_{42} = 0.0012.
\]

The simulations for comparison are presented using above initial data and parameters in Figure 31 and 32.

7.3 Comparison between piecewise model and real data in Spain

In this subsection, we present a comparison between the daily number of cases on 23 February and 20 April 2021 in Spain and the model that is divided into 9 pieces. To do comparison, considering above notations, we consider the following model

\[
\begin{align*}
\frac{dX_i}{dt} &= f_i(t, X_i), & \text{if } 0 \leq t \leq T_1 \\
X_i(0) &= X_{i,0}, & i = 1, 2, \ldots, 7 \\
dX_i(t) &= f_i(t, X_i) + \sigma_i X_i dB_i(t), & \text{if } T_1 \leq t \leq T_2 \\
X_i(T_1) &= X_{i,1}, & i = 1, 2, \ldots, 7 \\
\frac{dX_i}{dt} &= f_i(t, X_i), & \text{if } T_2 \leq t \leq T_3 \\
X_i(T_2) &= X_{i,2}, \\
dX_i(t) &= f_i(t, X_i) + \sigma_i X_i dB_i(t), & \text{if } T_3 \leq t \leq T_4 \\
X_i(T_3) &= X_{i,3}, & j = 8, 9, \ldots, 14 \\
dX_i(t) &= f_i(t, X_i) + \sigma_i X_i dB_i(t), & \text{if } T_4 \leq t \leq T_5 \\
X_i(T_4) &= X_{i,4}, & k = 15, 16, \ldots, 21 \\
dX_i(t) &= f_i(t, X_i) + \sigma_i X_i dB_i(t), & \text{if } T_5 \leq t \leq T_6 \\
X_i(T_5) &= X_{i,5}, & l = 22, 23, \ldots, 28 \\
dX_i(t) &= f_i(t, X_i) + \sigma_i X_i dB_i(t), & \text{if } T_6 \leq t \leq T_7 \\
X_i(T_6) &= X_{i,6}, & m = 29, 30, \ldots, 35 \\
dX_i(t) &= f_i(t, X_i) + \sigma_i X_i dB_i(t), & \text{if } T_7 \leq t \leq T_8 \\
X_i(T_7) &= X_{i,7}, & n = 36, 37, \ldots, 42 \\
dX_i(t) &= f_i(t, X_i) + \sigma_i X_i dB_i(t), & \text{if } T_8 \leq t \leq T \\
X_i(T) &= X_{i,8}, & p = 43, 44, \ldots, 49
\end{align*}
\]

The parameters and initial conditions are as follows

\[
\begin{align*}
X_1(0) &= 1060000, X_2(0) = 2000, X_3(0) = 1, X_4(0) = 1, X_5(0) = 1, X_6(0) = 1, X_7(0) = 1 \\
X_1(T_1) &= 6169 \times 10^6, X_1(T_2) = 2218 \times 10^8, X_1(T_3) = 1176 \times 10^9, X_1(T_4) = 3157 \times 10^9, \\
X_1(T_5) &= 1158 \times 10^9, X_1(T_6) = 1616 \times 10^9, X_1(T_7) = 1234 \times 10^9, X_1(T_8) = 2835 \times 10^{10}, \\
X_2(T_1) &= 81470, X_2(T_2) = 346400, X_2(T_3) = 789600, X_2(T_4) = 1693000, X_2(T_5) = 185600, \\
X_2(T_6) &= 8615000, X_2(T_7) = 1837000, X_2(T_8) = 8801 \times 10^3, X_3(T_1) = 94.74, X_3(T_2) = 2483, \\
X_3(T_3) &= 802.8, X_3(T_4) = 10460, X_3(T_5) = 15640, X_3(T_6) = 30210, X_3(T_7) = 15350,
\end{align*}
\]
\[ X_3 (T_8) = 40400, \quad X_4 (T_1) = 8518 \times 10^4, \quad X_4 (T_2) = 276 \times 10^7, \quad X_4 (T_3) = 1749 \times 10^7, \]
\[ X_4 (T_4) = 5072 \times 10^7, \quad X_4 (T_5) = 1704 \times 10^7, \quad X_4 (T_6) = 2097 \times 10^8, \quad X_4 (T_7) = 1534 \times 10^7, \]
\[ X_4 (T_8) = 4639 \times 10^8, \quad X_5 (T_1) = 2223000, \quad X_5 (T_2) = 7358 \times 10^4, \quad X_5 (T_3) = 4652 \times 10^5, \]
\[ X_5 (T_4) = 119 \times 10^5, \quad X_5 (T_5) = 3766 \times 10^5, \quad X_5 (T_6) = 6673 \times 10^6, \quad X_5 (T_7) = 5703 \times 10^5, \]
\[ X_5 (T_8) = 1222 \times 10^7, \quad X_6 (T_1) = 2324 \times 10^4, \quad X_6 (T_2) = 3017 \times 10^5, \quad X_6 (T_3) = 3406 \times 10^6, \]
\[ X_6 (T_4) = 1092 \times 10^7, \quad X_6 (T_5) = 1215 \times 10^7, \quad X_6 (T_6) = 332 \times 10^8, \quad X_6 (T_7) = 1592 \times 10^7, \]
\[ X_6 (T_8) = 8128 \times 10^7, \quad X_7 (T_1) = 4752, \quad X_7 (T_2) = 155600, \quad X_7 (T_3) = 1111 \times 10^3, \quad X_7 (T_4) = 321 \times 10^4, \]
\[ X_7 (T_5) = 1975000, \quad X_7 (T_6) = 13830000, \quad X_7 (T_7) = 3502 \times 10^3, \quad X_7 (T_8) = 3013 \times 10^4, \]

and

\[
\Lambda = 48000000, \quad N = 47000000, \quad \alpha_E = 0.3366, \quad \alpha_I = 0.6396, \quad \alpha_W = 0.1886, \quad b_{qs} = 0.8667, \quad (67)
\]
\[
b_{aq} = 0.015, \quad \kappa = 1.66, \quad \lambda = 0.0182, \quad \beta = 0.014, \quad b_{eq} = 0.34103, \quad \delta = 4.82, \quad b_{ic} = 0.00626,
\]
\[
b_{qc} = 0.1333, \quad b_{cr} = 1/5, \quad k_1 = 0.01, \quad k_2 = 0.0235, \quad \lambda_w = 0.011, \quad T_1 = 15, \quad T_2 = 60, \quad T_3 = 144,
\]
\[ T_4 = 205, \quad T_5 = 220, \quad T_6 = 261, \quad T_7 = 295, \quad T_8 = 350, \quad \sigma_1 = \sigma_8 = \sigma_{15} = \sigma_{22} = \sigma_{29} = \sigma_{36} = 0.008, \]
\[ \sigma_9 = \sigma_{10} = \sigma_{16} = \sigma_{23} = \sigma_{30} = \sigma_{37} = \sigma_{44} = 0.0094, \quad \sigma_3 = 0.21, \quad \sigma_{24} = 0.2, \quad \sigma_{38} = \sigma_{45} = 0.15, \]
\[ \sigma_{10} = \sigma_{17} = \sigma_{31} = 0.25, \quad \sigma_4 = \sigma_{11} = \sigma_{18} = \sigma_{25} = \sigma_{32} = \sigma_{39} = \sigma_{46} = 0.0078, \]
\[ \sigma_5 = \sigma_{12} = \sigma_{19} = \sigma_{26} = \sigma_{33} = \sigma_{40} = \sigma_{47} = 0.0084, \]
\[ \sigma_6 = \sigma_{13} = \sigma_{20} = \sigma_{27} = \sigma_{34} = \sigma_{41} = \sigma_{48} = 0.0079, \]
\[ \sigma_7 = \sigma_{14} = \sigma_{21} = \sigma_{28} = \sigma_{35} = \sigma_{42} = \sigma_{49} = 0.0012. \]

The simulations for comparison are provided using above initial data and parameters in Figure 33 and 34.

8 Conclusion

Nature can be better understood or even predicted if the limitations of existing theories, approaches, methods are questioned, revised and updated. This is also the case in epidemiological modeling, for many decades several theories have not been revisited but are still used even to analyze complex problems that cannot be really understood using existing theories. For example, how can we predict waves for a given infectious disease using existing methods? Although significant results have been suggested and some highly informative, however, when looking at the spread of Covid-19, especially data from some countries, one will quickly realize that some of them exhibit crossover behaviors, for example a passage from patterns with deterministic features to stochastic. We have attempted to open a new window of modeling such problems, by using the concept of piecewise modelling. We present some illustrative examples. The agreement of the piecewise models and experimental data let no doubt that this approach will help mankind to better predict crossover behaviors appearing in nature.
