Abstract

Mass gatherings frequently include close, prolonged interactions between people, which presents opportunities for infectious disease transmission. Over 20,000 pilgrims gathered at Namugongo Catholic and Protestant shrines to commemorate 2022 Uganda Martyr’s Day. We described syndromes suggestive of key priority diseases particularly COVID–19 and viral hemorrhagic fever (VHF) among visiting pilgrims during May 25–June 5, 2022. A suspected COVID–19 case was defined as ≥2 signs or symptoms of: fever >37.5°C, flu, cough, and difficulty in breathing whereas a suspected VHF case was defined as fever >37.5°C and unexplained bleeding among pilgrims who visited Namugongo Catholic and Protestant shrines from May 25 to June 5, 2022. Pilgrims were sampled systematically at entrances and demarcated zonal areas to participate in the survey. Additionally, we extracted secondary data on pilgrims who sought emergency medical services from Health Management Information System registers. Descriptive analysis was conducted to identify syndromes suggestive of key priority diseases based on signs and symptoms. Among 1,350 pilgrims interviewed, 767 (57%) were female. The mean age was 37.9 (±17.9) years. Nearly all pilgrims 1,331 (98.6%) were Ugandans. A total of 236 (18%) reported ≥1 case definition symptom and 25 (2%) reported ≥2 symptoms. Twenty-two (1.6%) were suspected COVID–19 cases and three (0.2%) were suspected VHF cases from different regions of Uganda. Among 5,582 pilgrims who sought
medical care from tents, 538 (9.6%) had suspected COVID–19 and one had suspected VHF. Almost one in fifty pilgrims at the 2022 Uganda Martyrs’ commemoration had at least one symptom of COVID–19 or VHF. Overall, we identified 4 Viral Hemorrhagic Fever and 560 COVID-19 suspected cases during the 2022 Uganda Martyrs’ commemoration. Intensified syndromic surveillance and planned laboratory testing capacity at mass gatherings is important for early detection of public health emergencies that could stem from such events.

**Keywords:** Syndromic surveillance, Mass gathering, Uganda

**Background**

According to the World Health Organization (WHO), a mass gathering is an event, either organized or spontaneous, characterized by concentration of people at a specific location for a specific purpose over a set period of time and has the potential to strain planning and response resources of the host country or community (1). During mass gatherings, overcrowding of attendees and influx of non-local travelers may present favourable and conducive environments for close, prolonged and frequent interactions increasing the opportunities for infectious disease transmission. What is quite challenging is that any adverse health outcome associated with mass gatherings would most likely be magnified by media and political attention. Furthermore, occurrence of a disease outbreak at or during an international mass gathering has an increased potential for spreading to neighboring countries or even globally; thus, the need for reporting under the 2005 International Health Regulations (2). Influx of people during mass gatherings impacts a strain on existing surveillance and response systems. This presents a challenge to the hosting community or country to strengthen surveillance and response systems during preparation, operational and post-event phases of mass gatherings.

Syndromic surveillance — the utilization of health-related data based on clinical observations and symptoms rather than confirmed diagnosis, can serve as an effective strategy for
appropriate real time monitoring, early detection and timely response to public health events
during mass gatherings (1, 3, 4). A provisional diagnosis or a “syndrome” can be established
through synthesis of a group of symptoms and clinical observations which consistently occur
together. During mass gatherings, syndromic surveillance has been implemented through
surveys – recording symptoms, review of medical registers completed by medical teams and
utilization of automated alert systems; followed by real-time analysis of data to generate
incident reports necessary for informing timely response actions (5). To date, syndromic
surveillance has been utilized in several mass gathering settings: 2002 Winter Olympic Games
in Salt Lake City; 2012 Summer Olympic and Paralympic Games in London; 8th Micronesian
Games in 2014, 2015 Los Angeles Special Olympic World Games; religious mass gatherings in
Southern India; 2016 Grand Magal of Touba in Senegal; and 2016 Arbaeenia mass gathering
in Iraq (3, 5-8).

Every year, in June, pilgrims from Uganda and neighboring countries gather at Namugongo
Catholic and Protestant shrines to commemorate the lives of Uganda Martyrs. In 2020 and
2021, Uganda Martyrs’ Day was not physically commemorated due to stringent strategies
deployed by Ministry of Health to curb the spread of the COVID–19 pandemic during mass
gatherings. In February 2022, the Ugandan Government relaxed the restrictions that had been
put in place to control COVID–19 thus approving full economy operation. Following the
relaxation of the COVID–19 restrictions, catholic and protestant religious bodies were
permitted to organize the commemoration of Uganda Martyr’s Day, a historical religious event
that calls for a mass gathering at Namugongo Catholic and Protestant shrines from May 25 to
June 5, 2022. Due to the distances people travel to attend this event, an infectious disease
outbreak that starts during this mass gathering has high potential to spread to neighboring
districts or even to other countries.

During the commemoration of the Uganda Martyrs in 2022, the Ministry of Health in
collaboration with the Uganda Catholic and Protestant Medical Bureaus provided health
services, including on-site emergency medical services in designated tents from May 25 to June 5, 2022. The Ministry of Health also provided Health Management Information System registers where data for pilgrims who sought medical care were captured by the medical teams to achieve harmonized reporting from the different institutions. Additionally, the National Rapid Response Team of the Ministry of Health were assigned to conduct syndromic surveillance for key priority diseases during the event. In this context, we described syndromes suggestive of key priority diseases among visiting pilgrims from May 25 to June 5, 2022 to inform future planning for mass gatherings in Uganda.

Methods
Study design
We adopted the cross-sectional study design to describe syndromes suggestive of key priority diseases among visiting pilgrims from May 25 to June 5, 2022.

Study setting and study population
This assessment was conducted among over 20,000 visiting pilgrims from Uganda and neighboring countries gathered at Namugongo Catholic and Protestant shrines located in Namugongo Division, Wakiso District, Uganda. On-site emergency medical services were provided in designated tents from May 25 to June 5, 2022 by medical teams comprising emergency medicine specialists, doctors, nurses, laboratory attendants, and ambulance teams from Ministry of Health, Mulago National Referral Hospital, St. Francis Hospital Nsambya, Uganda Martyrs Hospital Rubaga, Uganda People’s Defence Forces, Uganda Police Force, Uganda Red Cross Society, St. John’s Ambulance, Holy Family Virika Hospital, Mengo Hospital, Zia Angellina Health Centre, and St. Stephens Hospital.

Data collection
We utilized two different methods for data collection. First, we conducted a survey among pilgrims at the Catholic and Protestant shrines based on signs and symptoms for key priority
diseases from June 2–5, 2022. The data collection tool was developed in KoboCollect based on signs and symptoms for selected priority diseases: COVID–19 and VHF s inclusive of Ebola Virus Disease, Crimean Congo Hemorrhagic Fever, Yellow Fever, Rift Valley Fever, and Marburg Hemorrhagic Fever. Signs and symptoms investigated were based on suspect case definitions as per the National Technical Guidelines for Integrated Disease Surveillance and Response. Signs and symptoms under investigation were: fever (temperature >37.5°C), cough, flu, headache, generalized body weakness, difficulty in breathing, jaundice, fainting or sudden collapse, and unexplained bleeding. Any other signs and symptoms reported by the participants were also recorded by the surveillance officers.

We sampled systematically every 10th pilgrim in the line at main entrance gates. Other pilgrims were selected randomly from demarcated zonal areas. Verbal informed consent was obtained from participants prior to interviews. Overall, surveillance officers from Makerere University School of Public Health interviewed 1,350 pilgrims who voluntarily participated in the survey. Survey data were downloaded in the Excel (.xls) format from the KoboCollect server and processed for analysis. Second, we conducted records review based on the on-site emergency medical services provided at the Catholic and Protestant shrines from May 25 to June 5, 2022. We extracted all the available data on 5,582 pilgrims who sought medical care from Health Management Information System registers for review including age, sex, district of residence, signs and symptoms or provisional diagnosis.

Data analysis
We conducted univariate data analysis using Epi Info 7 software (CDC, Atlanta, USA) to obtain frequencies of demographic characteristics and syndromes suggestive of public health emergencies among pilgrims who participated in the survey or sought care from the medical tents. Only syndromes suggestive of key priority diseases were of interest to the investigative team. At analysis phase, a suspected COVID–19 case was defined as ≥2 signs or symptoms of: fever >37.5°C, flu, cough, and difficulty breathing whereas a suspected VHF case was defined.
as fever >37.5°C and unexplained bleeding among pilgrims who visited Namugongo Catholic and Protestant shrines from May 25 to June 5, 2022.

Ethical considerations

This investigation was in response to an annually commemorated mass gathering and was therefore determined to be non-research. The Ministry of Health (MoH) gave the directive to conduct syndromic surveillance during this religious event. The Office of the Associate Director for Science, Centres of Disease Control and Prevention/Uganda, also determined that this activity was not human subject research, and its primary intent was public health practice or a disease control activity (specifically, epidemic or endemic disease control activity). Verbal consent in English and the local language was sought from pilgrims before participation in the survey. They were informed that their participation was voluntary and their refusal would not result in any negative consequences. Pilgrims were assigned unique identifiers instead of using their names to protect the confidentiality of the respondents. Administrative clearance to extract patient data from Health Management Information System registers was obtained from the Ministry of Health. All methods were performed in accordance with the approval and administrative clearance.

Results

Characteristics of pilgrims who participated in the survey during the Uganda Martyrs' commemoration mass gathering, June 2–5, 2022

Among the 1,350 pilgrims who participated in the survey, 767 (56.8%) were females. Nearly all pilgrims 1,331 (98.6%) were Ugandans. The majority of pilgrims 1,157 (85.7%) visited the Catholic shrine (Table 1).

**Suspected priority diseases**

Among the 1,350 pilgrims who participated in the survey, 653 (48.4%) reported at least one sign or symptom during their visit to the Catholic and Protestant shrines. Of these, 236 (18%) reported ≥1 suspected COVID–19 and VHF case definition signs and symptoms and 25 (2%) reported ≥2 symptoms (Figure 1). Twenty-two (1.6%) were suspected COVID–19 cases and three (0.2%) were suspected VHF cases from different regions of Uganda, two were bleeding from the nose and one had bloody vomitus and urine.
Among 5,582 pilgrims who sought care at the medical tents, 3,796 records specified the presenting signs and symptoms whereas 1,786 records did not have specified signs and symptoms but only had a provisional diagnosis based on the clinician’s assessment. Of 3,796 records, 539 pilgrims reported at least 2 symptoms suggestive of key priority diseases. Of these, 538 (9.6%) had suspected COVID–19 and one had suspected VHF with bloody vomitus (Figure 2).
Discussion

In this study, we described syndromes suggestive of key priority diseases among visiting pilgrims from May 25–June 5, 2022 to inform future planning for mass gatherings in Uganda. We identified 4 VHF and 560 COVID–19 suspected cases through syndromic surveillance during the 2022 Uganda Martyrs’ commemoration. Similarly, previous incidences of outbreaks have been reported following festive, religious and sporting-related mass gatherings including a COVID–19 outbreak after festivities in Spain; outbreaks of diarrheal diseases during the 2019 Hijja pilgrimage in Saudi Arabia; mumps following festive activities in Austria and Spain; measles after an international youth sporting event in United States of America; meningococcal disease associated with the 23rd World Scout Jamboree gathering in Japan; and influenza H1N1 outbreaks after music festivals in Belgium and Hungary (1, 10-15). Mass gatherings have been highly characterized as transmission sites for infectious diseases due to
close proximity and rapid and possibility of dissemination of infectious agents after the mass
dispersion to different locations (16).

During the COVID–19 pandemic, mass gatherings were highlighted among the sources of
transmission due to overcrowding and close interaction between attendees. In 2020, a social
gathering at Church X provided an opportunity for a COVID–19 superspreading event in
Omorro District, Northern Uganda (17). A recent systematic review reported that religious
gatherings in places of worship were vital in COVID–19 transmission accounting for over 50
worship related clusters especially during the first wave of the pandemic (18). Mass gatherings
have been significantly associated with COVID–19 transmission (10, 19-21). It should also be
noted that risk of transmission of infectious diseases could be partly influenced by the type,
venue, location and demographics of participants who attend the mass gatherings (22-24).
Evidence of COVID–19 transmission during mass gatherings has also been reported in
Malaysia during the Sri Petaling Moslem Missionary Movement (25). Due to such scenarios,
the WHO published interventions which should be implemented to mitigate the spread of
COVID–19 during mass gatherings (26).

Limited evidence has been presented on the incidence of VHFs during mass gatherings.
However, there is still need for great vigilance since most VHFs are largely characterized by
person to person transmission which could be highly favored by the close contact between
attendees during mass gatherings. Experience from mass gathering events held during the
West African Ebola epidemic illustrates that these events can be held safely provided
interventions are instituted for enhanced surveillance and response systems for infectious
diseases (27). This underscores the urgent need of implementing effective measures to mitigate
the spread of any VHF during such annual mass gatherings.

However, there were only seventeen trained surveillance officers despite the masses at the
Namugongo Protestant and Catholic shrines, who started administering the survey
questionnaire on June 2, 2022 instead of having commenced on the May 25, 2022, at the time
when pilgrims started gathering. Therefore, it was difficult to generalize the findings on the
signs and symptoms for selected priority diseases to the entire population that converged
during the 2022 Uganda Martyrs’ commemoration. Additionally, 1,786 out of 5,582 records
did not have specified signs and symptoms but only had a provisional diagnosis based on the
clinician’s assessment. We could not categorize these pilgrims under any of the key priority
diseases since they did not have specified signs and symptoms; which could have
underestimated the syndromes suggestive of key priority diseases.

Conclusion

Almost one in fifty pilgrims at the 2022 Uganda Martyrs’ commemoration had symptoms of
COVID–19 or VHF. Overall, we identified 4 Viral Hemorrhagic Fever and 560 COVID-19
suspected cases during the 2022 Uganda Martyrs’ commemoration. Unfortunately, none of
the suspected COVID–19 or VHF cases were tested and we do not know what condition they
had. While we have no evidence that the suspected VHF cases had any link to the 2022 Ebola
Virus Disease outbreak in Uganda, it is clear from these findings that a surveillance system at
mass gatherings and the ability to actively respond to possible cases is critical. It is important
for us to prioritize intensified syndromic surveillance during mass gatherings to ensure that we
reduce the risk for an outbreak at mass gatherings in Uganda and reduce the impact if one
should occur. Furthermore, there is utmost need to set up isolation facilities for any suspected
cases and provide laboratory testing capacity to facilitate early detection and response to
priority key diseases that could stem from such events.

Acknowledgments

The authors would like to thank medical teams from Ministry of Health, Mulago National
Referral Hospital, St. Francis Hospital Nsambya, Uganda Martyrs Hospital Rubaga, Uganda
People’s Defence Forces, Uganda Police Force, Uganda Red Cross Society, St. John’s
Ambulance, Holy Family Virika Hospital, Mengo Hospital, Zia Angellina Health Centre, and
St. Stephens Hospital who provided onsite emergency medical services at the Catholic and
Protestant shrines. Additional thanks to surveillance officers from Makerere University School of Public Health (MakSPH) who administered survey questionnaires to pilgrims at the Catholic and Protestant shrines.

**Funding and disclaimer**

This project was supported by President’s Emergency Plan for AIDS Relief (PEPFAR) through US Centers for Disease Control and Prevention Cooperative Agreement number GH001353 through Makerere University School of Public Health. Its contents are solely the responsibility of authors and do not necessarily represent the official views of US Centers for Disease Control and Prevention, Department of Health and Human Services, Makerere University School of Public Health, or Ministry of Health. The staff of the funding body provided technical guidance in design of the study, ethical clearance and collection, analysis, and interpretation of data, and writing the manuscript.
