Abstract

Introduction: There are now well-established global standards for supporting improvement in women’s experience of maternity services, including frameworks for the prevention of mistreatment during childbirth. Given the ongoing reports from Timor-Leste outlining poor quality of care in maternal health services and the low use of health facilities for birth, we aimed to examine the adoption of global respectful maternity care standards in intrapartum care policies in Timor-Leste. Methods: From May to July 2022, we conducted a desk review of the Timor-Leste National Intrapartum Care Standards and Clinical Protocols for Referral Facilities and Community Health Centres. This was followed by a health-facility audit of policies, guidelines and procedures in three main maternity facilities in the capital, Dili to examine the extent to which the WHO (2016) standards for women’s experiences of care have been adopted. Results: Despite the availability of global guidelines, key standards to improve women’s experience of care have been omitted from the National Intrapartum Care guidelines in Timor-Leste. There was no mention of avoiding mistreatment of women, needing informed consent for procedures, or

NOTE: This preprint reports new research that has not been certified by peer review and should not be used to guide clinical practice.
strengthening women’s own capability and confidence. In the policy wording, women tended to be
distanced from the care ‘procedures’ and their involvement was framed around being told what to do
during the birth process. The results of the health facility assessment showed extremely low use of
standards that improve women’s experiences of care. Health Facility 1 and 2 met two of the 21 quality
measures, while Health Facility 3 met none of them. **Conclusion:** The discourse communicated through
policy fundamentally affects how health care issues are framed and how policies are enacted. Given the
findings of this study, combined with the widespread documentation of poor quality of care, low
satisfaction with maternal health services, and emerging stories of physical and verbal abuse of women
during birth, there is a need for a fundamental shift in the culture of care for women in Timor-Leste. This
will require an immediate focus on leadership, training and policy-frameworks to stop mistreatment of
women in health facilities. It will also require a longer-term focus on addressing the power imbalances
that drive disrespect and abuse of women within and across social systems, and understanding how to
support relationship-based models of care that inherently foster understanding and compassion.

**Keywords:** respectful care, maternal health, disrespect and abuse, obstetric violence, facility assessment,
policy, audit, implementation.

**Introduction**

The care women receive during pregnancy, birth and in the postnatal period is intimately linked to
their well-being and that of their newborn infants. Poor quality of maternal health care across the perinatal
period is associated with increased risk of birth trauma [1, 2], birth and postpartum complications [3] and
has flow-on effects for maternal and infant mortality [4-6]. Improving the quality of maternal healthcare is
integral to women’s and children’s right to health, contributing to their equitable access and positive
experience with health care [7].

Respectful maternity care is care that is organised and provided to women in a way that maintains
their dignity, privacy and confidentiality, ensures freedom from harm and mistreatment, and enables
informed choice and continuous support during labour and birth [7]. The WHO [5] framework for quality maternal and newborn health care establishes measurable standards of care and provides a foundation for improving the quality of maternity care in health facilities. In addition to provision of care standards, the framework incorporates women’s experience of care, including standards for effective communication; respect and preservation of dignity; and emotional support.

These standards provide important guidance for policy-makers, managers and researchers, to assess strengths and gaps in health service-systems and develop processes to improve care over time [5]. When issues central to women’s experience of care are left out of health policy and facility protocols, women and families are more likely to be exposed to disrespectful, abusive and coercive behaviour by healthcare providers [8]. This can culminate in a highly traumatic experience of birth [1], feelings such as fear of childbirth [9] and avoidance of healthcare [10].

The woman-centred care agenda, foregrounding women’s experiences of care, has gained traction globally and national health systems are starting to adopt these global standards. Despite this progress, gains can be slower in poorly resourced health systems [11]. In Timor-Leste, the quality of maternal health care has long been identified as a central health systems issue [12-15]. Maternal mortality has steadily declined since the country gained independence from Indonesia in 2002, however, only 48% of women give birth in a health facility and the steepest decline is between first birth and second birth (nationally, 63% of first births occurred in a health facility, 48% for second or third birth, 41% for fourth or fifth birth, and 35% for sixth or more) [16]. The contribution of poor quality of care toward preference for home birth has not yet been quantified, however it is likely to be a contributing factor in Timor-Leste as the National Demographic Health Survey showed 56% of women had concerns about being treated respectfully when accessing health care [16].

Given such prevalence of concern raised by women, and the importance of clear policies and frameworks to start addressing the issue at multiple levels [17], we examine the adoption of the WHO [5] Standards for Improving Quality of Maternal and Newborn Care in Timor-Leste. The study uses the
Experience of Care standards as a framework to review the national Timor-Leste Intrapartum Care Guidelines [18, 19] and perform an audit of site-specific policies and protocols at three major health facilities in the country’s capital, Dili.

**Methods**

**Study design**

For this study we adopted a critical perspective of policy transfer [20]. The research consisted of a policy review and health facility audit, based on the WHO [5] Standards for Improving Quality of Maternal and Newborn Care in Health Facilities. This study was part of larger program of research being undertaken by author AF, on women’s experiences of disrespect and abuse during childbirth in Dili (initial qualitative study, survey with women on prevalence of mistreatment, and this policy assessment). In this way, the findings presented here are part of a broader assessment on provision and experience of respectful care, to inform gaps and ways forward for policy and practice in Timor-Leste.

**Sampling technique**

The study was conducted in the capital city, Dili, as this municipality has the highest proportion of facility-based births (83% of births in a health facility, compared with 48% nationally) [16]. Dili also contains the largest referral hospital in the country as well as six community health centres providing primary health care and birthing services. Three health facilities were sampled based on the highest number of births per month. The facilities have been de-identified and are denoted as Health Facility 1, 2 and 3.

**Ethical approval and permission**

Ethical clearance was obtained from the Ethical Review Committee at Airlangga University, Indonesia (ID# 071/HRECC.FODM/III/2022). Reciprocal approval was obtained from Timor-Leste’s Human Ethics Committee at the National Institute for Health (INS – *Instituto Nasional Saude*) in Dili (ID# 603MS-INS/GDE/IV/2022). At each of the study sites, the health facility or maternity department manager
was contacted, the research explained and a letter of approval from INS was provided. The study was also
approved through the ethics department of the larger study facility.

Policy review

Deductive content analysis was used to compare the extent to which the concepts in the WHO [5] Standards and Quality Statements (4-6 on experiences of care) had been incorporated into the Timor-Leste National Intrapartum Standards of Care and Clinical Protocols [18, 19]. The national policies were first read and reviewed as a whole, then a word search was performed to further identify specific concepts and how they were framed within the documents.

Health facility audit

An audit tool (Table 2-7) was derived from the WHO [5] Standards 4-6 on Experiences of Care. These included the Input Quality Measures for:

- Standard 4 on Effective Communication: 4.1 All women and their families receive information about the care and have effective interactions with staff.
- Standard 5 on Respect and Preservation of Dignity: 5.1 All women and newborns have privacy around the time of labour and childbirth, and their confidentiality is respected; 5.2 No woman or newborn is subjected to mistreatment, such as physical, sexual or verbal abuse, discrimination, neglect, detainment, extortion or denial of services; 5.3 All women can make informed choices about the services they receive, and the reasons for interventions or outcomes are clearly explained.
- Standard 6 on Emotional Support: 6.1 Every woman is offered the option to experience labour and childbirth with the companion of her choice; 6.2 Every woman receives support to strengthen her capability during childbirth.

The ‘Input Quality Measures’ for each of these standards was developed into a table, with a tick-box column to indicate whether the criteria were present or not at each facility (Table 2-7). The wording for each quality measure was adapted for the context of Timor-Leste through rephrasing for clarity, and then
translated to Indonesian as the research is being undertaken at an Indonesian University. For example, WHO Standard 4.1 ‘Easily understood health education materials, in an accessible written or pictorial format, are available in the languages of the communities served by the health facility’ was rephrased as ‘Health education materials are available in Tetum, with easily accessible writing or pictures, and are given by midwives to birthing women’. Some input measures were omitted if they were not applicable to the Timor-Leste context, for example standards referring to detainment for non-payment, as Timor-Leste has a free public healthcare system.

At each study facility a department manager was contacted, the research was explained and a time was made to visit the service. Interviews were conducted from May to July 2022. Written informed consent was provided by the participant and they were interviewed by AF in the local language, Tetun, to assess whether each of the input criteria were met. Item responses consisted of “Yes”, meaning the health facility had the policy, guideline or equipment in place, or “No” meaning it did not exist at the time of the interview. Where policy was only somewhat compliant with the standard, participants were probed for further comment until consensus was reached.

**Results**

**Adoption of WHO standards in national intrapartum care policies**

The review of the Timor-Leste national intrapartum Standards of Care and Clinical Protocols for Community Health Centres [18] and Referral Facilities [19] showed that the WHO Experience of Care Standards were only marginally adopted. The Timor-Leste guidelines briefly referenced supportive care, in the form of four dot points in the whole document [18]. These tended to be general statements, without specific actions or directions on how to achieve them. For example, with regard to effective communication, the only reference in the protocols was a dot point stating ‘Communication with patient and family about progress and problems and management’. For respect and preservation of dignity, there was one dot point in the document stating ‘Respect for clients (respect during care and discussions and maintain privacy..."
during examinations). Within this concept of respect, there was no mention of not mistreating women or newborns, and no mention of avoiding physical, sexual or verbal abuse, discrimination, neglect, detainment, extortion or denial of services. Similarly, there was no mention of informed choice, consent or that reasons for interventions or outcomes should be clearly explained. For emotional support there was one dot point stating ‘If requested, allow one accompanying person of women’s choice in labour room’ (author emphasis added). There were no statements around strengthening a woman’s own capability and confidence during childbirth. Overall, any reference to supportive care in the national protocols was very sparse (total of four dot points) and the wording of these points was very general (i.e. Comfort: physical and emotional). It is worth noting that the way birthing women were positioned in the policy wording tends to remove them as active agents in the birth process, and fails to address women’s social and emotional wellbeing and their right to choice.

Health facility assessment

The findings of the health facility assessment show all of the sampled facilities scored low on quality measures for Experiences of Care (Table 1). Health Facility 1 and 2 had the highest score, meeting two of the 21 criteria, while Health Facility 3 met none of them. Following is a breakdown of challenges within each domain.

Effective communication

None of the WHO recommended standards for supporting effective communication between women and their care providers were in place in any of the surveyed health facilities (Table 2). There were no birth education materials for women (for example pain management, relaxation, how to push during labour), and there were no specific policies in place to promote midwives’ communication and counselling skills. Only one of the health facilities had received in-service training on interpersonal communication (provided by INS). However, it was not provided regularly and they did not receive follow-up training or support. The main communication issues identified by the interview participants were midwives not introducing themselves to women, not involving women in choices about what actions were taken during their labour and birth and not providing opportunities to discuss women’s concerns. There were also no induction or supervision mechanisms to support midwives’ communication and counselling skills.

Privacy and confidentiality

Health facility 1 and 2 had a separate room for birth, but it was small (3 x 4 meters). There were sometimes difficulties fitting people in the room, especially when students were observing. The third health facility had two beds in the ‘delivery’ room. This was a problem when two women were giving birth, and the companion of the other birthing woman could either see and overhear, or would be asked to leave the room. There was also lack of space and privacy for women in labour, who often had to stay on the postnatal ward (large shared room) due to lack of space. When curtains and partitions were present, they were not always used by the health providers, and curtains provide no sound protection. In addition, there were no written protocols to guide staff on the importance of or how to promote privacy and confidentiality (Table 3).

Avoid mistreatment

There were no policies outlining the need to avoid mistreatment of women, accountability mechanisms, or the rights of women to make complaints (Table 4). Although there was a complaints box at one of the health facilities, there was no mechanism to check or review it, and it was empty during the time of the interview. Participants at all facilities said their midwifery staff had not received in-service training or supportive supervision about avoiding mistreatment or respecting women’s rights.

Informed consent

There were no written policies outlining the need to obtain women’s informed consent before examinations or procedures such as episiotomy, vaginal examination, or perineal suturing (Table 5). While there was a consent procedure to perform cesarean section, there were no standard consent forms available and a lack of process around seeking consent for other procedures such as vaginal examination and episiotomy. In addition, participants reported that their midwifery staff had not received in-service training or supportive supervision on informed consent procedures or women’s right to choose their care.

**Companion of choice**

There were no written protocols that encouraged women to have a companion of choice during labour, birth or post-partum (Table 6). One participant said their staff often asked women if they would like a family member to accompany them. The shared birthing room in one of the health facilities was particularly problematic for male birth companions, who were not allowed to enter the room when there was more than one woman using the space. Midwives in the study facilities had not been provided with in-service training on the positive impact of labour companion, and there was no information to orient companions on their role in supporting women during birth.

Strengthen women’s capability

Interview participants said that their midwives had not been oriented to use of pharmalogical or non-pharmalogical pain relief, nor in strengthening their interpersonal communication in providing emotional support, and had not received in-service training in relation to these. There were no protocols to minimise unnecessary interventions or strengthen a woman’s own capability during birth (Table 7).

Discussion

Despite availability of global guidelines to support respectful maternity care and prevent mistreatment of women during childbirth [5, 7, 21, 22], this study found that key standards to improve women’s experience of care have been omitted from the national intrapartum care guidelines in Timor-Leste [18, 19]. Most significantly, there was no mention of avoiding mistreatment of women, needing informed consent for procedures, or strengthening women’s own capability and confidence. Given the failure to acknowledge women’s experience of care within national policy, it is not surprising that the
audited health facilities met so few of the Experience of Care standards. Health Facility 1 and 2 had the highest score, meeting two of the 21 quality measures, while Health Facility 3 met none of them. Without policies that prioritise respectful woman-centred care, women are at risk of disrespect directly as a result of harmful policies [23], or indirectly as a result of lack of guidance, oversight and procedural consequence for neglectful or harmful practice [11, 24].

Qualitative research on women’s experience of mistreatment, conducted by the authors in the same audited health facilities, revealed that women were subjected to frequent physical and verbal abuse by their birth attendant [25]. This included hitting her, forcing her thighs open, stitching her perineum without pain relief, shouting and being angry, and humiliating her. The abuse was most severe in the second stage of labour, during the intense pain of birth, and when the birth attendant perceived the woman was not following their instructions [25].

The discourse communicated through policy, the tone and wording within documents, fundamentally affects how health care issues are framed and how policies are enacted [26]. In the national intra-partum care guidelines [18, 19] women were distanced from the care ‘procedures’, their views and wishes were rarely mentioned, and their involvement was limited to being directed on what to do during the birth process. The lack of attention given to respectful care in maternal health policy, in combination with the authoritative discourse within the guidelines, mirrors the broader gender inequality and disempowerment of women in Timorese society [27]. Given the high rates of family violence in Timor-Leste (35% experienced violence from their partner in the past 12 months), in combination with the high fertility rate of 4.2 births per woman [16], there is likely to be substantial intersections of abuse and trauma for women, repeated in multiple settings and over multiple births.

Policy improvements are fundamental to practice improvements, as adequate policies, procedures and accountability mechanisms are linked to behaviour of health care providers, with flow on effects for improved birth experiences and better outcomes for women and families [8]. In addition to policy guidance, calls for improvements in training and supportive supervision are echoed across existing literature [2, 8, 21,
Training should include confronting the normalisation of violence against women within families and across systems, the belief that mistreatment is necessary to minimise clinical harm, reflection on our own psychological and emotional responses in various scenarios [32] and strategies that encouraged introspection and cultural humility [33].

There is an immediate need for greater awareness, training and policy frameworks in Timor-Leste that directly address how to stop mistreating women. Evidence suggests, however, that simply having policies and training is not enough, as health systems interact with structural inequality and individual interpersonal dynamics to underpin the disrespect and abuse of women [34]. Key organisational factors such as high workload, low pay, resource shortages, and lack of professional autonomy and supervision and feedback mechanisms have been identified as contributing factors that need to be addressed at a systems level [35]. The WHO [21] has long argued that ending disrespect and abuse during childbirth must be approached comprehensively. This has been reinforced in recent reviews of strategies to prevent mistreatment, in that they emphasise the need to address the power-related drivers of mistreatment across the ecological model (i.e. intrapersonal, interpersonal, community, organizational, and law/policy) [36], as well as transforming institutional leadership and approaches to supervision that tackle existing power hierarchies [35]. Given the findings in of this study, combined with the widespread documentation of poor quality of care, low satisfaction with maternal health services, and emerging stories of physical and verbal abuse of women during birth in Timor-Leste [12-16, 25, 37], there is a need for an urgent and fundamental shift in the culture of care for women, a shift that needs to be based on the diverse experiences of birthing women in Timor, and their vision of what better models of maternity care would look like across the country.

**Conclusion**

Lack of policy frameworks that prioritise women’s experiences of care hinders the ability to implement respectful ways of working with women in maternal health services. The National Intrapartum
Care guidelines in Timor-Leste are not woman-centered, and minimize women’s autonomy, their right to choice and freedom from violence. Further exploration is required to understand the lack of priority given to addressing harm at the highest level of policy, and to promote national leadership in this area. Given the dearth of research on interventions and models that increase respectful care and reduce mistreatment, this is a priority area for further research and maternity care reform in Timor-Leste.
