The authors have withdrawn this manuscript for the following reasons:

1. Our latest analysis (mid-February, 2022) that includes the addition of 59 children with 3 completed timepoints shows a decrease in N antibodies at T2, versus this preprint that showed an increase in N antibodies from T1 to T2.
2. This preprint did not include those infected with the Omicron variant, which has had a substantial impact on the increase in pediatric infections and has important implications for antibody durability moving forward as such.

Therefore, the authors do not wish this work to be cited as reference for the project. If you have any questions, please contact the corresponding author.
