21 **ABSTRACT**

22 We report the sequencing and detection of 39 Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-
23 CoV-2) infections in the Philippines identified to be caused by viruses under the B.1.1.7 lineage (UK
24 variant). Genome sequences obtained from these samples carry the lineage-defining mutations
25 associated with the said variant of concern.

26

27 **ANNOUNCEMENT**

28 In this study, we present the genome sequences of 39 cases of Severe Acute Respiratory Syndrome
29 Coronavirus 2 (SARS-CoV-2) infections in the Philippines that were found to be caused by lineage B.1.1.7
30 viruses, more commonly known as the UK variant. This particular virus variant was initially identified in
31 the United Kingdom and has been reported to cause a surge of SARS-CoV-2 infections in the said country
32 (Kirby, 2021). Initial studies also suggest that the B.1.1.7 viruses appear to have replicative advantage
33 (Grabowski et al., 2021) and are more transmissible (Leung et al., 2021).

34

35 **Table 1** shows the primary consensus assembly metrics for these samples. The average depth of coverage
36 across all the sequences is 1,128x, with 33 of the samples carrying all 17 hallmark mutations of the B.1.1.7
37 lineage (**Figure 1**) as listed in the PANGO Lineages report for the B.1.1.7 variant of concern ([https://cov-
38 lineages.org/global_report_B.1.1.7.html](https://cov-lineages.org/global_report_B.1.1.7.html)).

39

40 The detection of B.1.1.7 from returning overseas Filipino workers and in the community highlights the
41 need for genomic surveillance at the country's ports of entry and the general population to monitor the
42 importation and local transmission of emerging variants of concern that may impact the public health
43 response to the SARS-CoV-2 pandemic in the Philippines.

44

45

46 **METHODS**

47 In order to detect the entry of B.1.1.7 infection in the Philippines, nasopharyngeal swabs were collected
48 between December 10, 2020 to January 31, 2021 from returning overseas Filipinos testing positive for
49 SARS-CoV-2, as well as from local case clusters mainly from the Cordillera Administrative Region of the
50 country, among others. The collected swab samples were then subjected to RNA extraction followed by
51 genome sequencing, which was done using the Illumina COVIDSeq workflow. Afterwards, the resulting
52 sequence reads were mapped to the reference SARS-CoV-2 genome (NCBI Accession Number
53 [NC_045512.2](#)) using Minimap2 (Li, 2018) version 2.17-r941, with the `–x sr` parameter for short accurate
54 genomic reads alignment.

55

56 Primer clipping and quality trimming, intrahost variant calling, removal of reads associated with
57 mismatched primer indices, and consensus sequence assembly were all done following the suggested
58 workflow of iVar (Grubaugh et al., 2019) version 1.2.2, using default parameters. The consensus variants
59 were identified by comparing the resulting assemblies with the reference sequence using MUMmer (Kurtz
60 et al., 2004) as implemented in the RATT software (Otto et al., 2011). SARS-CoV-2 lineage classifications
61 were also assigned to the local viral samples using Pangolin version 2.3.2 ([github.com/cov-](https://github.com/cov-lineages/pangolin)
62 [lineages/pangolin](https://github.com/cov-lineages/pangolin); Rambaut et al., 2020).

63

64

65 **PUBLIC AVAILABILITY AND ACCESSION NUMBERS**

66 The consensus sequence assemblies reported in this study are deposited in the [EpiCoV™ database of the](#)
67 [GISAID](#). The accession codes are shown in **Table 1**.

68

69

70 **ACKNOWLEDGEMENT**

71 This project was supported by a Genomics Biosurveillance grant from the Philippine Department of
72 Health, and a Department of Science and Technology – Philippine Council for Health Research and
73 Development grant to BM and the University of the Philippines.

74

75

76 **ETHICS APPROVAL**

77 The protocols used in this study were reviewed and approved by the Single Joint Research Ethics Board of
78 the Department of Health, with approval code SJREB-2021-11, as part of a larger research program
79 entitled “A retrospective study on the national genomic surveillance of COVID-19 transmission in the
80 Philippines by SARS-CoV-2 genome sequencing and bioinformatics analysis”.
