11

12 **ABSTRACT**

13 Tuberculosis (TB) remains a disease of public health significance at the Australia / Papua New Guinea
14 (PNG) international border. In the remote Torres Strait Islands, aeromedical evacuation is a
15 necessary but costly component of TB management and patients with critical care needs require
16 support to prevent onward TB transmission. A detailed costing of an exemplar TB patient from PNG
17 who presented to a Queensland Health facility in the Torres Strait and required urgent aeromedical
18 evacuation was performed. Data were drawn from patient charts, financial and clinical information
19 systems used within Queensland Health and the Torres and Cape Hospital and Health Service. The
20 total cost of aeromedical evacuation was AUD 124,280; 54% of the cost was attributed to travel.
21 Between 2016 and 2019, 19 patients diagnosed with TB were medically evacuated from an outer
22 Torres Strait Island with a median length of hospital stay of 57 days. Aeromedical evacuation and
23 medical management costs require adequate budget allocation.

35 **Introduction**

36 The Papua New Guinea (PNG) / Torres Strait border area is potentially a major source of drug
37 susceptible, mono-resistant, drug-resistant and multi-drug resistant TB (MDR-TB) into Australia [1]. At
38 the closest point, the Torres Strait Islands in Queensland are less than 5kms from PNG's Western
39 Province [2]. Cross border dynamics and current TB prevention and control efforts are largely
40 attributable to geographical, regional, political and administrative complexities and structures [3].
41 Prior to international border closures in March 2020 due to the COVID-19 pandemic [4], the Torres
42 Strait Treaty allowed residents of 13 Treaty villages in the Western Province of PNG and 14
43 communities of the Torres Strait Islands in Australia to cross the international border for traditional
44 purposes without health checks, visas or passports [5] (Figure 1). This freedom of movement coupled
45 with the conservative TB incidence rate of 674 cases per 100,000 population in the Western Province
46 of PNG [6], places the Indigenous population of the Torres Strait Islands of Queensland, Australia
47 particularly vulnerable to TB transmission [7].

 52

¹ Traditional inhabitants of the Torres Strait Protected Zone and Treaty villages may cross this international border without passport or visa. DOI. <https://doi.org/10.6084/m9.figshare.16632823.v1>

53 PNG Treaty villages are among the poorest and most remote in PNG and lack access to clean running
54 water and electricity [2]. Health service provision in the PNG Treaty villages is poor and in 2018, seven
55 basic medical units and one health centre were frequently unstaffed or unstocked with basic medical
56 supplies. The closest major health facility from the Treaty villages in the Western Province of PNG, is
57 Daru General Hospital, located at least two hours away by personal boats powered by small outboard
58 motors [2]. Hence, PNG residents frequently cross the narrow stretch of water separating the two
59 countries to attend well-resourced Queensland Health Primary Health facilities located in the Torres
60 Strait Islands in Australia [3].

61

62 Aeromedical evacuation is a necessary component of Queensland Health's obligation to provide
63 critical health care services to anyone presenting to Torres and Cape Hospital and Health Service
64 (TCHHS) primary health centres (PHCs) in the Torres Strait Protected Zone (TSPZ) including residents
65 of PNG that live adjacent to the Torres Strait Islands (Figure 1). In recognition of health services
66 provided to PNG nationals within the Queensland Health system, funding provided through the
67 Commonwealth's 'Managing Torres Strait / Papua New Guinea Cross Border Health Issues (Schedule
68 B) National Partnership Agreement', was AUD 18.9 million, between 1 July 2016 to 30 June 2020,
69 averaging AUD 4.7 million per year [8]. This study describes detailed costing of the medical evacuation
70 and medical management of one PNG national patient diagnosed with pulmonary TB who presented
71 to Boigu Island in 2019 and who was subsequently admitted to both Thursday Island and Cairns
72 Hospitals (Figure 1).

73

74 Medicare is Australia's health insurance scheme which provides free or low-cost access for all
75 Australians to public hospitals, other medical services and medication [9]. Typically, overseas visitors
76 whose countries do not have a Reciprocal Health Care Agreement with Australia are considered to be
77 Medicare ineligible [10]. Medicare ineligible patients are responsible for fees and charges associated
78 with both outpatient and inpatient care in Queensland [10]. As PNG does not have a Reciprocal Health

79 Care Agreement with Australia [11], PNG nationals without a Medicare card who enter Australia via a
80 designated port, must pay for health services received. The exception to this rule is for PNG nationals
81 who enter the Australian health care system via the TSPZ [12]. While these patients are still Medicare
82 ineligible, costs incurred for managing and treating them are absorbed by Queensland Health Hospital
83 and Health Services (HHSs), with partial funding to offset costs provided by the Australian Government
84 Department of Health. This, in addition to remoteness and travel, are some of the reasons that the
85 cost of health care per capita / per service rendered, is higher for HHSs in Far North Queensland than
86 is typical across funding structures in other HHSs in Queensland [12].

87

88 The Australian Government provides important and strategic funding to manage the delivery of health
89 services to PNG nationals which specifically includes but is not limited to the management of TB
90 patients [8] to address transmission risk from PNG to Australia [13]. This funding is not intended to be
91 used for PNG patients who have arrived in Australia with a passport at an authorised port, rather, it is
92 designated for HHSs to provide healthcare to PNG nationals entering via the TSPZ. At no 'out of pocket'
93 expense for PNG patients, funding includes but is not limited to: hospital admissions, outpatient
94 services, management of TB patients, pathology, pharmaceuticals and patient transport [8]. Although
95 Schedule B of the National Partnership Agreement states that funding for health services rendered
96 includes '*patient transport (such as medical evacuations)*' [8], the Commonwealth funding does not
97 cover the majority of expenses incurred by the services undertaking or supporting aeromedical
98 evacuations such as Aeromedical Retrieval and Disaster Management Branch (ARDMB)-supported
99 aeromedical evacuation, and these additional costs are borne by Queensland Health. This Federal
100 funding allocated to managing PNG nationals seeking health care via the TSPZ is absorbed into the
101 total funding pool for all health services rendered in HHSs.

102

103 **Materials and Methods**

104 The journey of a PNG national patient who presented to Boigu Island PHC in a critical condition and
105 diagnosed with fully-susceptible pulmonary TB, was selected to cost a typical aeromedical retrieval
106 case of TB. The case was considered typical (without excessive additional costs) as the patient was not
107 accompanied by an escort and did not have drug-resistant TB or comorbidities which may have
108 resulted in an extended hospital admission.

109

110 Details of the clinical presentation and pharmaceuticals, pathology, imaging and procedures ordered
111 were reviewed in the TCHHS electronic medical record system, Best Practice, and in the TB patient
112 information database used by the Torres and Cape TB Control Unit. Pathology and imaging services
113 provided were cross checked against Queensland's laboratory results database AUSLAB, imaging
114 databases Enterprise PACS and Merlin Web, and state-wide health service database The Viewer [14]
115 (Appendix A). The Viewer and Best Practice were also accessed to ascertain the length of hospital stay
116 for patients who were medically evacuated.

117

118 Aeromedical evacuation (Boigu Island to Thursday Island; Thursday Island to Horn Island and Horn
119 Island to Cairns) costs to support this patient were sourced from the ARDMB. The ARDMB centrally
120 manage funding and contracts with the Queensland Department of Health and Queensland
121 Ambulance Service (QAS). QAS fund associated paramedic support when required during aeromedical
122 evacuations in TCHHS. Both ARDMB and QAS sit within Queensland Health.

123

124 Clinicians within TCHHS will contact Retrieval Services Queensland (RSQ) with requests for
125 aeromedical retrieval. RSQ are part of the ARDMB and centrally coordinate triaging, and the dispatch
126 of paramedic support and aircraft including the rescue helicopter to respond to medical events
127 requiring aeromedical evacuation [15,16]. The Royal Flying Doctors Service (RFDS) provide additional
128 support for inter-facility transfers between Horn Island and Cairns on fixed-wing aircraft. Costs of
129 RFDS interfacility transfer flights are funded by ARDMB through the Queensland Department of

130 Health as part of a state-wide contract to provide aeromedical support to Queensland communities
131 (Appendix A). ARDMB will then recoup a proportion of costs from TCHHS. Costs were expressed in
132 Australian dollars. See Appendix A for extended methodology.

133 Written consent from the patient was obtained for this study. Ethical approval was granted by the Far
134 North Queensland Human Research Ethics Committee (HREC) (HREC/17/QCH/74-1157), and the Chair
135 of James Cook University HREC, (H7380). Public Health Act authorisation (QCH/36155 – 1157) was also
136 obtained to access patient data. Written approval was separately obtained from the Queensland
137 ARDMB Research Committee, and Queensland Ambulance Service Torres and Cape York Local
138 Ambulance Service Network.

139

140 **Results**

141 Table 1 shows that the cost to medically evacuate and medically manage one PNG national with
142 uncomplicated fully-susceptible pulmonary TB from Boigu Island in 2019 was AUD 124,280. The total
143 cost to medically evacuate the patient was AUD 58,029, with the remainder costs attributed to
144 pathology, outpatient assessment, inpatient stay, pharmaceuticals and other travel. The Rescue 700
145 flight from Boigu Island to Thursday Island and then from Thursday Island to Horn Island Airport
146 comprised the single biggest expense (AUD 48,900), followed by in-patient care in Cairns Hospital
147 (AUD 45,760).

148

149 **Table 1.** Cost of managing a Papua New Guinea patient with drug-susceptible tuberculosis (TB)
150 requiring aeromedical retrieval from Boigu Island to the Australian health system in 2019².

² † Category 2 Emergency

¶ Includes costs associated with meals, wages, cleaning, diagnostic imaging/procedures and pathology. See Table 2 for actual imaging/procedures and pathology costs incurred

§ The total cost of the Royal Flying Doctors Service inter-facility transfer flight from Horn Island to Cairns was \$8,730 which was funded by ARDMB through Queensland Department of Health. ARDMB recovered a proportion (72%) of the full amount from TCHHS.

‡ Rescue 700 flight from Boigu Island to Thursday Island and Thursday Island to Horn Island Airport

†† Wages of Queensland Ambulance Service paramedic to travel from Thursday Island to Boigu Island return on the Rescue 700 flight

¶¶ Includes road transfers from Cairns Airport to Cairns Hospital and road transfers and commercial flights from Cairns to Boigu Island to repatriate

Costs rounded to the nearest Australian dollar

156 The median length of stay in the Australian healthcare system for 19 PNG patients diagnosed with TB
157 and medically evacuated between 2016 and 2019 was 57 days (26-107). The length of stay for the
158 patient in the case study was 24 days. Patients who received care in both Thursday Island and Cairns
159 Hospitals experienced a median length of stay of 102 days, compared to a median stay of 43 days
160 when receiving care in both Thursday Island and Townsville Hospitals.

161

162 **Discussion**

163 The economic burden of managing and treating TB patients is clear across different populations, and
164 comparison of previously reported costs, with the cost of managing PNG nationals at the Australian
165 border is complex. The cost to medically evacuate and manage a patient with pulmonary TB in this
166 study was AUD 124,280. This is more than ten-fold higher than the average cost of providing full
167 treatment to fully susceptible TB patients in Victoria, Australia, at AUD 11,583 [17]. Similarly, meta-
168 analyses of TB treatment costs in the European Union estimated the average total cost to treat a fully
169 susceptible TB patient was EU 10,282 (AUD 17,213.47) [18]. It is important to point out that this
170 patient had drug-susceptible TB, which is associated with greatly reduced in-patient care expense
171 compared to patients with highly drug-resistant TB. Most published cost analyses report the total cost
172 of administering a full course of anti-TB treatment, whereas the primary goal for managing a critically
173 unwell PNG national TB patient entering Australia via the TSPZ is to stabilise, diagnose, commence on
174 treatment and refer back to the PNG health system for continuation of their treatment and care.

175

176 In total, TB-related presentations make up a small proportion of all patients who receive and are
177 retrieved for care in the Torres Strait. In a typical year, there are just under 100 aeromedical
178 evacuations from Torres Strait outer islands involving PNG nationals, of which around ten are TB-
179 related. The designated funds provided by the Australian Government Department of Health to
180 compensate Queensland Health for healthcare provision to PNG nationals seeking healthcare via the
181 TSPZ under Schedule B is AUD 4.7million per year. If each aeromedical evacuation costs a similar

182 amount to our case study, there is a total shortfall in funding of over AUD 7.5 million per year to
183 medically evacuate and manage PNG nationals. However, the true costs are unknown as analyses such
184 as in this study are not routinely performed. In addition to better compensation for Queensland
185 Health, greater transparency of expenditure and contractual milestone attainment could be achieved
186 if the funds were held separately instead of being absorbed into HHSs.

187

188 As a result of the COVID-19 pandemic-related border closure between Australia and PNG in March
189 2020, residents of the Treaty villages living adjacent to the Australian border have experienced a
190 reduction in access to TB diagnostics, treatment and critical care, and it is likely that household
191 transmission of TB has increased during this time. As Australia prepares to open up to the world once
192 more, it will be imperative that Queensland Health are prepared for a potential influx of patients with
193 critical care needs from PNG.

194

195 **Conclusion**

196 Funding of emergency evacuations for TB and other illnesses in this remote region, is necessary,
197 unavoidable and expensive, and current levels of funding do not meet the demand. The high cost of
198 patient care in such a remote setting, points to the benefit of supporting patients with critical care
199 needs to prevent onward transmission of TB, as well as adequate budget allocation for aeromedical
200 evacuation when required.

201

202

203

204

205

206 **Appendix A.** Extended methodology: the cost to medically evacuate and manage one Papua New
207 Guinea national diagnosed with pulmonary tuberculosis within the Australian health system.
208

209 The cost of this patient's outpatient and inpatient clinic visits was obtained from
210 Queensland Health's fees and charges register [19]. Hospital and Health System cost
211 categories included outpatient services confirmed as a Category 2 Emergency,
212 pharmaceuticals, inpatient hospital stay, Royal Flying Doctors Service inter-facility
213 transfer flight and other travel. The cost of inpatient hospital admission for Medicare
ineligible patients includes clinician wages, meals, cleaning, pathology / procedures and
diagnostic imaging.

214 Outpatient service expenses provided at Boigu Island Primary Health Centre include
215 wages, cleaning, diagnostic imaging/procedures and pathology. Pharmaceuticals were
216 calculated separately. Wages for the Torres and Cape TB Control Unit staff involved in
providing an outpatient service to manage this patient were also calculated and reported
separately.

217 Most travel-related costs (excluding aeromedical retrieval within the Torres Strait
218 Islands) are borne by the Hospital and Health System in the jurisdiction where the
219 patient first presented, regardless if additional travel across Queensland was required.
All costs were reported separately for each health facility and the total cost of each
category was provided.

220 The costs of pharmaceuticals were calculated by determining the full cost for any one
221 item (i.e. box of Isoniazid 300mgs tablets), and multiplying this cost by the number of
222 boxes or fractions of boxes required (this was obtained by dividing the number of doses
223 administered to the patient by the total number of doses per box). Pathology was
224 calculated per pathology request form rather than per test ordered, as per State billing
requirements [20]. Item numbers for imaging services provided were obtained from the
Queensland Health Medicare Benefits Schedule (MBS) Radiology Billing Manual [21] and
then cross matched for cost from the MBS online [22].

225 Travel costs (excluding Boigu Island to Thursday Island; Thursday Island to Horn Island
226 and Horn Island to Cairns) were sourced from the Torres and Cape Hospital and Health
227 System patient travel and finance/revenue teams. These travel costs pertain to
228 commercial flights and patient transport to and from relevant airports and hospitals.
Travel costs did not include any expenses incurred by the patient or the Western
Provincial Health Authority in PNG.
