Cost-effectiveness of HIV retesting in Viet Nam

38 ABSTRACT

39 Background

HIV testing and counseling is a key component of HIV prevention and the entry point into the treatment cascade, which improves for individual clinical outcomes and reduces onward HIV transmission. Current guidelines recommend at least annual testing for key populations. More frequent testing could provide health benefits, but these additional services increase the program the cost-effectiveness is not wellevaluated.

45 Methods

We used a compartmental mathematical model to simulate the health and economic impact of HIV testing one to four times per year for men who have sex with men, people who inject drugs, and female sex workers in Viet Nam. Model outcomes included costs, HIV infections, HIV-related deaths, and disability-adjusted life years (DALYs) associated with each scenario. We used an opportunity cost-based cost-effectiveness threshold of US \$2,255 per DALY averted, discounted costs and health benefits at 3% annually, and used a time horizon from 2021 to 2030 to calculate incremental cost-effectiveness ratios (ICERs).

53 Results

54 Compared to the baseline scenario, more frequent HIV testing was estimated to incrementally avert 55 10.2%, 5.2%, 3.0%, and 1.6% discounted infections for one-, two-, three-, and four-tests per year, 56 respectively. ICERs associated with each scenario ranged from \$464, \$1,190, \$1,762, and \$2,727 per 57 DALY averted for one-, two-, three-, and four-tests per year, respectively.

58 Conclusions

Increased HIV testing frequency for key populations was projected to avert HIV incidence, mortality, and disability in Viet Nam and was cost-effective. Settings with a similar context should consider strategies on how to optimize retesting among key populations.

Cost-effectiveness of HIV retesting in Viet Nam

62 Background

The World Health Organization (WHO) recommends initiation of antiretroviral treatment (ART) for all 63 64 persons testing positive for HIV regardless of CD4 count and the United Nations Joint Programme on HIV/AIDS (UNAIDS) put forth the 95-95-95 goals which seek to ensure 95% of persons living with HIV are 65 aware of their status, provide ART for 95% of those diagnosed, and maintain viral suppression among 66 95% persons living with HIV on ART by 2030.^{1,2} Although mathematical models of the 95-95-95 goals 67 predict large declines in HIV incidence, empirical estimates of HIV incidence reductions have been less 68 69 than expected, and that feasibility and costs present challenges in attaining such ambitious targets.³⁻⁷ 70 Late diagnosis and delayed ART initiation are key barriers to reaching HIV incidence reduction goals, as acute infections become a larger proportion of total transmission as ART is scaled up.^{4,8} 71

Key populations including men who have sex with men, people who inject drugs, and female sex workers are disproportionately impacted by HIV, comprising over 60% of new HIV infections globally with a lower proportion tested, linked to care, and virally suppressed compared to the general population.^{9–11} While data on knowledge of HIV positive status among key populations are limited, UNAIDS estimates of that between 62-67% of key populations living with HIV globally are aware of their status compared to 81% for all persons living with HIV.^{9,12}

Current WHO HIV testing guidelines recommend retesting at least annually for key populations.¹³ 78 79 However, the optimal testing frequency for high incidence populations to rapidly diagnose and treat 80 individuals is not well evaluated. More frequent HIV retesting strategies could increase the rate of 81 persons living with HIV diagnosed and initiated on ART, and maybe required to reach the goal of 95% of persons living with HIV aware of their status.¹⁴ However, more frequent testing will also increase 82 83 program costs through additional commodity procurement, as well as increasing health systems burden, 84 program coordination, and outreach. There are also opportunity costs to consider, as resources 85 allocated to more frequent HIV testing could be used for a competing health need.

Viet Nam has a national HIV prevalence of less than 1% in the general population, but prevalence ranges between 3-25% among men who have sex with men, people who inject drugs, and female sex workers.^{15,16} While Viet Nam has made universal ART with financing through its social health insurance scheme and the Global Fund to Fight AIDS, Tuberculosis and Malaria, ART coverage stands at 69%. This suboptimal ART coverage could be due to incomplete linkage to care among the newly diagnosed and loss to follow-up. Another key barrier to universal ART could be a low rate of diagnosis. Furthermore, the HIV funding landscape in Viet Nam has been transitioning from donor to national social health

Cost-effectiveness of HIV retesting in Viet Nam

- insurance which has a mandate to meet priority health needs including HIV.¹⁷ The cost-effectiveness and
 impact of health interventions provide evidence for policy makers to support efficient resource
 allocation. In this study, we modeled the health and economic impact of increased HIV testing frequency
- 96 in key populations in Viet Nam to identify the most cost-effective frequency for retesting.

97 Methods

98 Setting and Populations

99 The target populations for this modeling analysis were adults aged 15 and greater who are people who 100 inject drugs, female sex workers, and men who have sex with men in Viet Nam. HIV prevalence ranged 101 from 12.7%, 3.6%, and 10.8% respectively (Table 1).

102 Model

103 We used the AIDS Impact Model within the Spectrum software package (v 6.1) to simulate the HIV epidemic in Viet Nam.¹⁸ The model is a deterministic, compartmental mathematical model that 104 simulates HIV transmission vertically from mother-to-child, intravenously via needle sharing, and 105 106 hetero- and homosexual behavior and estimates HIV incidence, AIDS-related mortality, and disability-107 adjusted life years (DALYs). DALY estimates are stratified by adults and children, CD4 count (<200 vs 108 \geq 200 cells/µL) and ART use. The model is age- and sex-stratified with compartments for risk groups such 109 as men who have sex with men, people who inject drugs, female sex workers and their clients, and low 110 and medium risk heterosexuals.

111 The model was parameterized with demographic, behavioral, transmission, programmatic, 112 epidemiological and efficacy data from government sources, surveys, surveillance, publicly available 113 reports, databases, and peer-reviewed literature. The model was calibrated to risk group-specific HIV 114 prevalence estimates for 2018-2019, total persons living with HIV, and HIV incidence within 1% of 115 national estimates. We simulated the impact of increasing HIV retesting frequency using the Goals 116 model within Spectrum.

117 Scenarios

The current national guidelines for HIV testing in Viet Nam recommend testing every six months for key populations. However, current utilization is estimated at approximately 50% testing annually and therefore falls short of that guideline. We use this level as the baseline scenario until 2030 – the time horizon for Viet Nam's national HIV strategic plan.¹⁹ We also simulated model scenarios with more frequent HIV retesting from one- to four-times per year among key populations from 2021 until 2030.

Cost-effectiveness of HIV retesting in Viet Nam

123 HIV testing and retesting has the potential to impact the HIV epidemic in two ways: 1) increasing 124 diagnosis and ART enrollment, and 2) resulting in behavior change including reduced number of sexual 125 partners, increased condom use, and decreased needle sharing. Results of a systematic review of the 126 effects of HIV testing on behavior yielded inconsistent findings, so we focus on the impact of HIV testing on ART enrollment.²⁰ However, data on impact of HIV testing on ART uptake, especially on retesting, is 127 128 extremely limited. Therefore, we made conservative assumptions on the linkage between testing 129 frequency and ART use. Counterfactual to no increase in HIV testing, we assume that ART coverage 130 meets the targets of the National Strategic Plan in 2025, and then continues to increase at historical 131 averages until 95% coverage is met in 2030, approximately an average increase of 3% per year. We 132 expect ART coverage to increase with scenarios of one-, two-, three-, and four-times per year. We 133 estimate the largest impact of HIV testing on ART scale-up is to occur as one moves from never testing 134 to a single test per year, with a decay in the marginal gains of additional annual tests (Figure 1). We 135 assume that ART use reduces transmission risk by 70% and reduces mortality risk by 80% with an 136 average 12-month retention of 83%.

We also assume condoms are 80% efficacious and that use among men who have sex with men is 50% and 80% among female sex workers. We assume 55% of people who inject drugs access needle and syringe exchange. We assume PrEP efficacy is 90% and adherence is 80%, while scale-up and utilization is less than 2% among female sex workers and people who inject drugs. For men who have sex with men we assume PrEP coverage increases to 6% by 2020 and reaches 23% by 2025 (in alignment with targets) and is constant up to 2030.

143 Costs

Costs were estimated from the provider perspective. We used local data on the personnel, commodities, and transport costs associated with testing and estimate the cost per HIV test at US \$4.50. ART costs were obtained from local sources and included personnel, commodities, clinical follow-up, and laboratory monitoring for an annual cost of US \$285, and we assumed individuals were on ART for an average of 25 years. For estimating net costs, the additional incurred costs due to faster ART scale-up as well as averted costs of ART through infections averted are also considered.

We do not assume that all individuals in target key populations get tested, nor do we assume that all available tests are utilized. We assume that 25% of key populations do not get tested annually. We assume that a decreasing proportion of the testing population utilizes additional tests with each scenario. Briefly, we assume 75% of persons would be tested once per year under a one-test per year

Cost-effectiveness of HIV retesting in Viet Nam

policy, while 68% would be tested twice under a two-test per year policy, 61% tested three times, and only 55% fully utilizing all four tests under a four-Test annually scenario (Figure 2). This generates an average number of tests per person of 0.5, 0.8, 1.4, 2.0, and 2.6 for Baseline, one, two, three, and four test per year scenarios.

158 Cost-Effectiveness Estimates, Thresholds, and Sensitivity Analysis

Health impact was measured in disability-adjusted life years (DALYs), infections, and AIDS-related deaths averted and aggregated over the 10-year time horizon. We use disability weights of 0.221, 0.547, and 0.053 for persons living with HIV with CD4 counts \geq 200 cells/µL, <200 cells/µL, and on ART, respectively.²¹ Incremental costs were calculated as the costs of increasing testing frequency, ART costs incurred and averted because of testing. Costs and health benefits were discounted at 3% per year.

National Health Technology Assessment guidelines for Viet Nam are currently under development by local authorities. We used an opportunity-cost-based cost-effectiveness threshold, based on a method previously described.²² Briefly, the approach uses an empirical opportunity cost estimate along with a nation's gross domestic product per capita and the value of a statistical life to refine the costeffectiveness threshold. Using this approach, we considered a threshold of US \$2,255 per DALY averted as cost-effective.

We conducted probabilistic sensitivity analyses on the following parameters: testing utilization, testing cost, ART cost, average years on ART, and intervention impact. We conducted 10,000 Monte Carlo simulations with random draws of parameter values across a specified distribution and report the proportion of simulated ICERs beyond our cost-effectiveness thresholds.

174 Results

175 Impact

Under the baseline scenario, we project a total of 43,886 new HIV infections and 14,503 AIDS-related deaths in Viet Nam from 2020 to 2030 (Table 2). We estimate that 3,953 (10.2%), 1,805 (5.2%), 1,002 (3.0%), and 498 (1.6%) new infections would be averted under policies of one-, two-, three-, and 4-tests per year, respectively (Figure 3). We estimate discounted AIDS-related deaths would be reduced by 616 (4.9%), 296 (2.5%), 166 (1.4%), and 92 (0.8%) for testing one-, two-, three-, and four-times per year, respectively. We further estimate that increased testing policies could avert 38,043, 18,124, 10,002, and 5,400 DALYs, respectively.

183 Costs

Cost-effectiveness of HIV retesting in Viet Nam

184 At baseline, we estimate HIV testing costs approximately US \$12.3 million. A one-test per year policy 185 would cost an additional US \$18.4 million, while incurring an additional US \$11.5 million in net ART costs 186 from 2020 to 2030. The cost of HIV testing increases almost linearly with each scenario, with some 187 reduction due to less than complete utilization. We estimate testing costs to be US \$35.0 million, US 188 \$49.9 million, and US \$63.4 million for two-, three-, and four-tests per year scenarios, respectively. 189 Conversely, net ART costs decline as treatment scale-up decelerates and additional costs are reduced 190 through HIV infections averted, resulting in net ART costs of US \$4.9 million, US \$2.7 million, and US \$1.3 191 million for two-, three-, and four-tests per year scenarios. In aggregate, incremental testing and 192 treatment costs yield US \$17.6 million, US \$21.6 million, US \$17.6 million, and US \$14.7 million for one-193 to four-tests per year.

194 Cost-Effectiveness and Sensitivity Analysis

We estimate the costs per DALY averted to be US \$464, US \$1,190, US \$1,762, and US \$2,727 for one-,
two-, three-, and four-tests per year scenarios, respectively. All but the four-test per year scenario ICER
estimates are less than the estimated opportunity-cost based threshold of US \$2,255.

From our probabilistic sensitivity analysis, we find our results are robust to a large variety of key input parameters (Figure 4). We find that 97% of modeled scenarios for one-test would be cost-effective, while 96%, 99.9%, and 100% of two-, three-, and four-tests per year scenarios are cost-effective from our sensitivity analysis.

202 We focus on cost of HIV testing and treatment, and health impact of increased testing frequency as 203 parameters of uncertainty and present the associated ICERs by scenario (Figure 5). On a univariate basis, 204 impact could fall by 80% and the one-test scenario would remain cost-effective (all else equal). 205 Conversely, with impact estimates held stable, the ICER for the one-test scenario remain cost-effective 206 even if costs increase by 3 times for the (all else equal). In the two-test scenario, latitude of cost-207 effective decreases to a 50% decrease in impact or 80% increase in cost. Three-test scenario only remain 208 cost-effective if impact does not drop beyond 20% of our estimate and costs do no increase by more 209 than 20%.

210 Discussion

We estimated the costs and health impact associated with greater HIV testing frequency among highrisk groups in Viet Nam. We found that scaling up more frequent testing among KP could avert a considerable HIV burden in alignment with expectations surrounding disproportionate risk attributed to

Cost-effectiveness of HIV retesting in Viet Nam

KP.²³ We estimate between 1.6%-10.2% of HIV infections and 0.8%-4.9% of deaths by 2030 in the whole population for HIV testing one- to four-times per year among KP. Testing one- to four-times per year would cost US \$464-\$2,727 per DALY averted. This health benefit would be achieved by accelerating HIV diagnosis and ART scale-up, as we estimate a policy testing four times per year could reach 95% ART coverage by 2024, rather than 2030 under the status quo testing uptake.

219 Knowledge of HIV status remains a persistent challenge globally, with only 81% of persons living with 220 HIV estimated to know their status, while only 63% and 75% are estimated to know their status in Asia 221 and Eastern Europe, respectively – regions where HIV incidence is disproportionally comprised of key populations like Viet Nam.²⁴ Late presentation (diagnosis with CD4 <200 cells/µL) remains common, 222 223 leading to higher rates of morbidity and mortality, and more downstream transmission. Those diagnosed late cite feeling healthy, stigma or fear, and inconvenience as reasons to delay testing.²⁵ 224 225 Higher uptake along with increased frequency of testing through differentiated testing modalities could further help close the gap to reaching the UNAIDS targets and national targets.¹⁹ 226

227 Recently, community-led HIV self-testing, index testing, and lay provider testing have been found to 228 have high levels of acceptability and uptake and offer further options for individuals in need of HIV testing services.^{26–28} Nevertheless, more frequent HIV testing and faster scale-up of ART alone is unlikely 229 to be sufficient to reach virtual elimination of HIV.²⁹ Other modeling efforts have suggested that even 230 universal ART coverage by 6 months following infection can leave notable levels of residual incidence 231 from transmission during the acute infection period.³⁰ Therefore, further scaling up HIV prevention 232 233 services, facilitated through increased HIV testing, will have an impact on both HIV prevention and 234 mortality reduction. Inclusion of additional testing modalities such as index and self-testing could build 235 upon this impact.

236 Our study has several limitations. First, there is limited quantitative information on the empirical link 237 between HIV testing frequency and ART uptake. However, we made a conservative assumption about 238 this relationship, and ultimately believe this link is plausible, necessary, and strong. Second, our cost 239 assumptions are based on local government data, and reflect current service delivery modalities, 240 efficiencies, and economies of scale and scope. Future costs of ART may continue to go down, as has 241 been well documented over the past 30 years, however some speculate that we are near the cost floor for treatment.^{31,32} In contrast, HIV testing may get more expensive, as bespoke testing modalities which 242 243 target individuals not served by existing approaches may be more expensive on a per person basis. 244 Alternatively, more frequent testing could benefit from economies of scale and marginal costs could

Cost-effectiveness of HIV retesting in Viet Nam

decrease.³³ Nevertheless, our estimates suggest that more frequent HIV testing would remain cost-245 246 effective, even in scenarios where per person testing costs increased by nearly three-fold, implying the 247 normative findings of cost-effectiveness are likely to remain unchanged even if more expensive testing models are needed to increase overall coverage and frequency. Finally, we made assumptions regarding 248 249 the uptake and utilization of HIV testing services. Preferences on the timing and frequency of HIV testing 250 by population is unknown in the aggregate, and at the individual level could vary tremendously over 251 time. We made conservative assumptions about testing uptake and assume that at least a guarter of the 252 target population may be reluctant to test, irrespective of policy.

Progress towards the first 95 of the UNAIDS targets is essential to achieving global and local goals of reducing the health burden and inequity of HIV and maintaining low HIV incidence. We believe that offering more frequent HIV testing services for high-risk populations could be an instrumental, costeffective, and affordable policy option. Further research should be focused on strategies to meet the preferences of clients' testing frequency, timing, and type, ensure these strategies are of high quality with high levels of linkage and retention, as well establish better empirical estimates of the costoutcome curve associated with more HIV testing.

Cost-effectiveness of HIV retesting in Viet Nam
