TITLE PAGE

The trends in the uninsured rates among non-elderly adult patients hospitalized with acute pancreatitis in the US during 2004-2019.

56

57 **Abstract**

58

59

60 **Background and Aim:**

61 The impact of health reforms such as affordable care act (ACA) and Medicaid expansion

62 program on health insurance coverage among acute pancreatitis (AP) patients in the United

63 States (US) is unknown. We report the trends and forecasts for the uninsured rates among acute

64 pancreatitis (AP) patients in the US.

65

66 **Methods:** We included non-elderly adult patients (aged 18 -64 years), hospitalized with AP in

67 the nationwide inpatient sample database years 2004- 2019. We calculated the percentage of

68 uninsured and Medicaid patients for each year and applied joinpoint (JP) regression model to

69 study the trends.

70

71 **Results** The uninsured rates among patients hospitalized with AP were almost twice compared to

72 the national average rates for all hospitalized patients. Uninsured rates were higher among

73 Hispanic and African American races, rural location, lower income quartiles and in the southern

74 US regions. A statistically significant decline was observed during 2013-2016 with an APC of -

75 12.23 (-20- -4); $p<0.01$). The decline was apparent among all racial groups, locations and

76 income groups but not in the southern region where gap in the uninsured rates worsened

77 compared to other geographical regions. The trends reversed more recently, and the uninsured

78 rates surged in 2018 for the first time after 2010. In 2019, 12.5% AP patients were uninsured

79 compared to 11.6% in 2017. The forecasts after taking unemployment rates into account showed

80 that uninsured rates would peak in 2020 followed by a gentle decline in the following years but

81 overall uninsured rates would remain higher compared to 2017.

Conclusions: The ACA and Medicaid expansion programs resulted in overall decrease in the uninsured rates, particularly among racial minorities, rural location and in the lowest income group. However, there was a surge in uninsured rate in the most recent years (2017-2019) which will continue during the next four years

105
106 Acute pancreatitis (AP) is one of the leading gastrointestinal causes of hospitalizations in the
107 United States (US) with its incidence increasing¹. In the year 2015, AP led to more than one million
108 hospitalization days in the US, resulting in more than \$2.5 billion in hospitalization charges². A
109 previous study has reported a higher incidence of uninsured patients in the year 2009-2012
110 compared to 2002-2005¹. So far, no study has reported the trends in the rates of uninsured patients
111 among AP patients. The lack of insurance has been associated with poor access to healthcare and
112 subsequent adverse outcomes³. In the US, the number of uninsured patients decreased after health
113 reforms such as the Affordable Care Act (ACA) and Medicaid expansion programs⁴. However, the
114 impact of ACA among patients with AP is still unknown. The non-elderly (aged 18-64 years old)
115 AP patients in the US are unique due to higher rates of alcohol and substance use, lower income
116 groups, and a higher fraction of minority races; all these factors are also associated with a lack of
117 health insurance in the US⁵. In this study, we aim to analyze the trends in the uninsured rates
118 among patients hospitalized with a principal diagnosis of AP in the last 15 years, emphasizing the
119 most recent trend changes. We examined the disparities in the health coverage among AP patients
120 by geographical regions, race, rural/urban status, and income levels. We also project the uninsured
121 rates among these patients for the next 4 years after adjusting for unemployment rates.
122 For this study, we included non-elderly adult patients, hospitalized with AP in the nationwide
123 inpatient sample (NIS) database for the years 2004- 2019¹². We collected data on uninsured and
124 Medicaid patients, race, rural/urban residence, income, and geographical regions for each year.
125 We calculated the percentage of uninsured and Medicaid patients for an individual year and applied
126 Joinpoint (JP) regression model to study the trends⁶. This program enables us to test whether an
127 apparent change in the trend is statistically significant by using Monte Carlo Permutation method

128 as the test of significance. The location of JP was not known prior and was estimated by the
129 program. Annual percent change (APC) and average annual percent change (AAPC) were
130 calculated with 'p' values to test if apparent changes in the trends were statistically significant. For
131 forecasting, we applied vector autoregression (VAR) model, a multivariate time series model, and
132 adjusted uninsured rates with the unemployment rates in the US. The unemployment rates were
133 obtained from the US Bureau of Labor Statistics of the US department of labor ⁷. Statistical
134 analysis was conducted using National Cancer Institute's Joinpoint regression software and 'R'.
135 The uninsured rates among patients hospitalized with AP were almost twice the national average
136 rates for all hospitalized patients (Fig 1a). Uninsured rates were higher among Hispanic and
137 African American races, rural locations, lower-income quartiles, and southern US regions (Table
138 1). The trends in the uninsured rates among AP patients mirrored the changes in the national rates,
139 but the gap persisted (Fig 1a). Overall, the change in the uninsured rate from 2004 to 2019 was not
140 statistically significant with an AAPC of -1 (-5.8-4.1); $p=0.7$). But a statistically significant decline
141 was observed during 2013-2016 with an APC of -12.23 (-20- -4); $p<0.01$). A simultaneous
142 increase in Medicaid coverage was also noticed (fig 1b). The decline was apparent among all racial
143 groups, locations, income groups and geographical regions, however uninsured rates in the
144 southern region remained considerably higher (Table 1). Unfortunately, trends reversed more
145 recently, and the uninsured rates surged in 2017 for the first time after 2010. In 2019, 12.5% AP
146 patients were uninsured compared to 11.7% in 2017. After adjusting for unemployment rates, the
147 uninsured rates are anticipated to increase drastically in the year 2020 to 16.04% (12.8-19.3),
148 followed by some decline in the following years 13.9(10.7-17.13) in 2021, 13.97 (10.7-17.2) in
149 2022 and 13.5(10.3-16.8) in 2023.

150 The higher uninsured rates among AP patients are due to these patients' unique characteristics, as
151 mentioned previously. On Joinpoint regression, we noted several periods with changes in the
152 uninsured rates. The most prominent was a decline in the years 2013-2016. In the US, a major
153 factor affecting the lack of insurance among the non-elderly population is unemployment⁸. While
154 the pattern in the uninsured rates during the initial years of the study was parallel to the
155 unemployment rates, the decline during the years 2013-2016 was out of proportion to what could
156 be explained by declining unemployment rates alone. In fact, this corresponded to the rollout of
157 ACA and Medicaid expansion in the US. By 2016, 33 out of 50 states had implemented
158 Medicaid expansion. The Medicaid expansion was lower in the southern region, where only 7
159 out of 16 states had implemented Medicaid expansion by the year 2016⁹. This observation also
160 explains the absence of a sharp decline among uninsured patients in the southern region, unlike
161 other regions in the US. The higher rates of uninsured among Hispanics and African American is
162 due to higher rates of unemployment and poverty, which is consistent with the overall rates of
163 uninsured in the USA¹⁰.

164 Unfortunately, we noted a rising trend in the uninsured in the years 2017-2019. This trend was
165 despite the declining rates of unemployment in the US during this time and is most likely the
166 result of several changes made in the year 2017 to roll back ACA. These changes included
167 waiving or delaying the features of ACA that imposed financial or regulatory burden, reduction
168 in the funding for ACA outreach and education program. Besides, there was also discontinuation
169 of cost-sharing reduction to insurers which led to the loss of incentives to purchase the coverage
170 and increased the uncertainty among the eligible individuals resulting in loss of health insurance
171 coverage¹¹.

172 To forecast the uninsured rates for the next three years, we adjusted for the unemployment rates.
173 Due to the pandemic, the unemployment rates increased drastically in the US in 2020 to 6.7,
174 almost double of 3.6 in 2019. As unemployment is a major driving factor for insurance among
175 the non-elderly population in the US, we anticipated a drastic rise in the uninsured rates, which
176 was found to be true. The projected rates are similar to the rates prior to implementing ACA
177 reforms which implies that we will probably lose most of the gains in terms of health coverage
178 that were achieved due to ACA if there are no significant changes in the policy.

179 The limitations of this study include the use of an administrative database using ICD-9 and ICD-
180 10 codes which is subject to misclassification bias. Besides unemployment other factors such as
181 patient preference may also affect the uninsured rates, which could not be analyzed due to the
182 limitations of the database. Nevertheless, we conclude that the ACA and Medicaid expansion
183 programs positively impacted the health insurance coverage among patients hospitalized with
184 AP, specifically on racial minorities and low-income groups. The impact was less apparent in the
185 southern US, where many states did not implement these reforms. Despite the strong US
186 economy and declining unemployment rates during 2017-2019, there was a surge in uninsured
187 patients, likely due to the changes made in the Medicaid policies. This surge is projected to
188 continue for the next few years. Therefore, new policies and reforms are warranted for the
189 communities at the highest risk of losing coverage-ethnic minorities and lower-income groups.
