-

⁴⁰⁹ parameters are equivalent for both groups, we exclude the subscript (e.g.,
$$
σ = σ_a = σ_b
$$
).
\n⁴¹⁰ Preferential within-group mixing is represented by homophily parameter *h*,
\n⁴¹¹ corresponding to the proportion of contacts that are within-group. When *h* is 0.5,
\n⁴¹² mixing is *uniform*, meaning that individuals are equally likely to contact members of
\n⁴¹³ their own group as members of the opposite group. As *h* approaches 1, mixing becomes
\nincreasingly separated, meaning that contacts are increasingly concentrated within
\n⁴¹⁵ groups. Similarly, we consider separation in awareness, *ε*, or the relative weight of in-
\n⁴¹⁶ group versus out-group awareness of deaths for protective behavior.
\n⁴¹⁷ The system of equations for group *a* is as follows (equations for group *b* can be derived
\n⁴¹⁸ symmetrically):
\n⁴¹⁹
$$
s\dot{v}_a = -\beta s v_a((h)(IU_a + \kappa I P_a) + (1 - h)(IU_b + \kappa I P_b)) - \theta s U_a \alpha_a(t) + \phi s P_a
$$
\n⁴¹⁰
$$
s\dot{v}_a = -\beta s v_a((h)(IU_a + \kappa I P_a) + (1 - h)(IU_b + \kappa I P_b)) + \theta s U_a \alpha_a(t) - \phi s P_a
$$
\n⁴¹⁰
$$
I\dot{v}_a = \beta s v_a((h)(I U_a + \kappa I P_a) + (1 - h)(I U_b + \kappa I P_b)) - \theta I U_a \alpha_a(t) + (\phi - \rho) I P_a
$$
\n⁴¹⁰
$$
I\dot{v}_a = \beta s v_a((h)(I U_a + \kappa I P_a) + (1 - h)(I U_b + \kappa I P_b)) + \theta I U_a \alpha_a(t) + (\phi - \rho) I P_a
$$
\n⁴¹¹
$$
I\dot{v}_a = \beta s v_a((h)(I U_a + \kappa I P_a) + (1 - h)(I U_b + \kappa I P_b)) + \theta I U_a \alpha_a(t) - (\phi + \rho) I P_a
$$
\n⁴¹²
$$
I\dot{v}_a = (\frac{1 - \mu}{\rho I} I) \
$$

where
$$
\alpha_a(t)
$$
 is the awareness equation for group *a*:
\n
$$
\alpha_a(t) = \int_{t-\ell}^t \left((\epsilon_a)(D\dot{U}_a + D\dot{P}_a) + (1 - \epsilon_a)(D\dot{U}_b + D\dot{P}_b) \right) dt
$$
\n(Equation 2)
\n**Vaccination model**
