## 29 **Abstract**

30 Objectives: The study aimed to conduct a bibliometric analysis of publications concerning lumbar  
31 spondylolisthesis, as well as explore its research topics and trends with machine-learning based  
32 text mining.

33 Methods: The data were extracted from the Web of Science Core Collection (WoSCC) database  
34 and analyzed in Rstudio1.3.1. Annual publication production and the top 20 productive authors  
35 over time were presented. Additionally, top 20 productive journals and top 20 impact journals  
36 were compared by spine-subspecialty or not. Similarly, top 20 productive countries/regions and  
37 top 20 impact countries/regions were compared by developed countries/regions or not. The  
38 collaborative relationship among countries and the research trends in the past decade were  
39 presented by R package “Bibliometrix”. Latent Dirichlet allocation (LDA) analysis was conducted  
40 to classify main topics of lumbar spondylolisthesis.

41 Results: Up to 2021, a total number of 4990 articles concerning lumbar spondylolisthesis were  
42 finally included for analysis. Spine-subspecialty journals were found to be dominant in  
43 productivity and impact of the field, and SPINE, EUROPEAN SPINE JOURNAL and JOURNAL  
44 OF NEUROSURGERY-SPINE were the top 3 productive and the top 3 impact journals in this  
45 field. USA, China and Japan have contributed to over half of the publication productivity, but  
46 European countries seemed to publish more influential articles. It seemed that developed  
47 countries/regions tended to produce more articles as well as high influential articles, and  
48 international collaborations focused on USA, Europe and eastern Asia. Publications concerning  
49 emerging surgical technique was the major topic, followed by radiographic measurement and  
50 epidemiology for this field. Cortical bone trajectory, oblique lumbar interbody fusion, oblique  
51 lateral lumbar interbody fusion, lateral lumbar interbody fusion, degenerative lumbar  
52 spondylolisthesis, adjacent segment disease, spinal canal stenosis, minimally invasive  
53 transforaminal lumbar interbody fusion and percutaneous pedicle screw were the recent hotspots  
54 over the past 5 years.

55 Conclusions: The study successfully summarized the productivity and impact of different  
56 countries/regions and journals, which should benefit the journal selection and pursuit of  
57 international collaboration for researcher who were interested in the field of lumbar  
58 spondylolisthesis. Additionally, the current study may encourage more researchers in the field and  
59 somewhat inform their research direction in the future.

## 70 **Introduction:**

71 Lumbar spondylolisthesis, especially in the elderly, is one of the most common causes of low  
72 back pain(1). Lumbar spondylolisthesis is defined as a slip of one vertebra over the other beneath,  
73 causing instability of the segment and compression of the cauda equina(2). The incidence of  
74 lumbar spondylolisthesis is 4-6% in the general population(3), which typically occurs in the  
75 occurs at the fourth and fifth lumbar vertebrae(4). In the United States, approximately 11.5% of  
76 the population suffers from this disease(5). Based on its etiology, lumbar spondylolisthesis can be  
77 divided into isthmic or degenerative spondylolisthesis. The former could be post-traumatic  
78 fractures in the pars interarticularis or congenital defects, while the latter is a result of disorders of  
79 the disc space or degenerative arthritis(6). Currently, the risk factors for spondylolisthesis are  
80 considered to be older age, female gender, larger body mass index and sagittal facet orientation(7).

81 According to the current agreement, the treatment of lumbar spondylolisthesis essentially  
82 incorporates conservative treatment or surgical treatment. The nonsurgical treatment options may  
83 include physical therapy, exercise, epidural steroid injections for pain, and medications. If  
84 conservative therapy fails, a surgical intervention was usually recommended(8). Surgical options  
85 include either decompression alone or decompression with fixation and fusion, with the essential  
86 objectives of neural decompression and stability reconstructions as well as restoration of sagittal  
87 alignment(9). Recently, minimally invasive spine surgery has been widely adopted in surgical  
88 management of lumbar spondylolisthesis(10-12). Therefore, probing and summarizing the  
89 research topics or trends of lumbar spondylolisthesis may benefit potential doctors and researchers  
90 who were interested in this field.

91 Bibliometric analysis is a powerful tool to depict the research activities of a certain field in  
92 details(13). For example, bibliometrics analysis can quantify the contribution of a research field  
93 (including different countries, institutions, journals, or authors), and to identify the research trends  
94 or topics in a particular field(14). Nowadays, bibliometric analysis has been widely adopted in  
95 summarizing medical fields, like emerging techniques(15-17) and common disease(18-20). In  
96 spine field, bibliometric studies about cervical myelopathy(21), spinal stenosis(22), spinal cord  
97 injury(23), scoliosis(24) are thriving. However, no bibliometric study concerning lumbar  
98 spondylolisthesis was available. Meanwhile, latent Dirichlet allocation (LDA) is a popular  
99 machine learning algorithm that has been accepted as a bibliometric tool to obtain research topics  
100 for a specific field(25-27). Thus, the purpose of this work is to explore the research topics and  
101 trends of lumbar spondylolisthesis via bibliometric analysis.

## 102 **Methods:**

### 103 **Data Acquisition**

104 Relevant literatures were collected from the Web of Science Core Collection (WoSCC) database.  
105 The search terms are “spondylolisthesis”. The time interval was set to 1975 to 2021. Only articles  
106 were included, and no language restrictions were applied. To avoid bias incurred by frequent  
107 database renewal, all literature retrieval and data downloads were completed in a single day, Jan  
108 18, 2022. Considering that data were directly downloaded from the data set, ethical approval was  
109 not required. WoSCC data of full record and references (including titles, countries of origin,  
110 institutions, journals, authors, etc.) were extracted in bib format and then imported into the

111 Rstudio1.3.1. for bibliometric analysis.

## 112 **Quantitative analysis**

113 Annual publication production and the top 20 productive authors over time were presented.  
114 Additionally, top 20 productive journals and top 20 impact journals were compared by  
115 spine-subspecialty or not. Similarly, top 20 productive countries/regions and top 20 impact  
116 countries/regions were compared by developed countries/regions or not. The productivity of  
117 journals and countries/regions was measured by the total number of publications, whereas the  
118 impact of journals and countries/regions was assessed by H-index or average article citations (15).  
119 H-index was characterized as the extent that an entity has published at least h papers that have  
120 been each cited at least h times (28). All the data were analyzed by Rstudio1.3.1 and R package  
121 “Bibliometrix” was used to conduct quantitative analysis of different entity’s contributions.

## 122 **Research topics and trends**

123 LDA can create a vocabulary of terms and then classify the included publications into different  
124 topics(18). We used the package “lda” in R language to conduct LDA analysis of included  
125 abstracts. The collaborative relationship among countries and the research trend in the past decade  
126 were presented by R package “Bibliometrix”.

## 127 **Results**

### 128 **General information**

129 Up to 2021, a total number of 4990 articles concerning lumbar spondylolisthesis were finally  
130 included for analysis. Average citations per documents reached 24.43, and average citations per  
131 year per documents reached 1.829. A total of 623 sources were identified while most sources were  
132 academic journals, as only a few articles were book chapters. Annual published articles  
133 concerning lumbar spondylolisthesis kept rising over time (**Figure 1**), and the publications of the  
134 latest 10 years contributed to 56.9% (2841/4990) productivity of this field. Similarly, almost all  
135 the top 20 productive authors published most of their articles concerning lumbar spondylolisthesis  
136 in years between 2010 and 2020.

### 137 **Quantitative analysis**

138 The top 20 productive journals and the top 20 impact journals publishing articles concerning  
139 lumbar spondylolisthesis were listed in **Table 1**. Articles in the top 20 journals (2789) were equal  
140 to 55.89% of all 4990 article publications. “SPINE” was the most productive journal (750 articles)  
141 and the most influential journal (H-index: 102) in the field. Similarly, “EUROPEAN SPINE  
142 JOURNAL” was the second productive (361 articles) and the second influential journal (H-index:  
143 49), while “JOURNAL OF NEUROSURGERY-SPINE” was the third productive (255 articles)  
144 and the third influential journal (H-index: 47). Most articles (1952/2789) were published by  
145 spine-subspecialty journals among the top 20 productive journals, even though only 9  
146 spine-subspecialty journals were in the top 20 productive lists. The top 3 influential journals all  
147 belonged to spine-subspecialty journals, although only one third of the top 20 influential journals  
148 were spine-subspecialty journals (7/20).

149 The top 20 productive and top 20 impact countries/regions publishing articles concerning

150 lumbar spondylolisthesis were listed in **Table 2**. Articles in the top 20 countries/regions (4468)  
151 were equal to 89.54% of all 4990 article publications. USA was the most productive country (1570  
152 articles) in this field, followed by China (536 articles) and Japan (531 articles). It was noted that  
153 Taiwan, as one of the most developed regions in China, accounted for nearly 20% of China's  
154 productive contributions. However, only three non-developed countries were in the top 20  
155 productive list, while developed countries/regions published 86.01% (3843/4468) articles among  
156 the top 20 productive lists. As we ranked the top impact countries/regions by average article  
157 citations, USA only ranked top 7 and Japan ranked top 16, while China was even not in the top 20  
158 influential list. Among this list, only one country belonged to non-developed economic entity.  
159

## 160 **Research topics and trends**

161 After removing articles without abstracts, a total of 4581 articles were finally included for LDA  
162 analysis. We found three major topics in this field, and named them as “Topic 1: surgery”, “Topic  
163 2: radiology” and “Topic 3: epidemiology” (**Figure 2**). The publication proportion of these three  
164 topics were 37.2%, 34.3% and 28.5%, respectively. Additionally, we presented how the  
165 productivity of these three topics evolved over time. It seemed that one third of publications were  
166 concerned about the radiographic measurement of lumbar spondylolisthesis (Topic 2: radiology),  
167 and it kept as the most productive topic for two decades (1990 to 2010). After 2010, publications  
168 concerning all kinds of surgical management (Topic 1: surgery) became the dominant topic, and  
169 publications concerning prevalence, risk factors, quality of life and conservative treatment of  
170 lumbar spondylolisthesis (Topic 3: epidemiology) joined as another mainstream topic after 2015.

171 Using term frequency, we obtained the research trends of lumbar spondylolisthesis over the  
172 past one decade (**Figure 3**). Cortical bone trajectory (CBT), oblique lumbar interbody fusion  
173 (OLIF), oblique lateral lumbar interbody fusion (OLLIF), lateral lumbar interbody fusion (LLIF),  
174 degenerative lumbar spondylolisthesis, adjacent segment disease (ASD), spinal canal stenosis,  
175 minimally invasive transforaminal lumbar interbody fusion (MIS-TLIF) and percutaneous pedicle  
176 screw were the recent hotspots over the past 5 years. **Figure 3** also showed the countries or  
177 regions collaboration map in the lumbar spondylolisthesis field. Countries or region connected  
178 with red lines indicated there were some collaborations among them and the thickness of the red  
179 line was proportional to the number of collaborations. It seemed that USA was the hub country of  
180 publications, because there are lots of red lines radiated from USA to European countries, China,  
181 Korea, Japan and even Australia. Although India, Brazil, China, Japan and some middle eastern  
182 countries were also productive, there were little collaborations among them.  
183

## 184 **Discussion**

185 Text mining and bibliometric analysis have been adopted widely in depicting a certain  
186 academic field in details. The current study quantified different entities' academic contributions to

187 lumbar spondylolisthesis, as well as provided an in-depth and visualized analysis of its topics and  
188 trends. To the best of our knowledge, this was the first bibliometric analysis of lumbar  
189 spondylolisthesis, which might help researchers gain a basic understanding, develop areas of focus  
190 and pursue further practice in this field.

191 Academic contributions of one field could be quantified by publication productivity and  
192 citation activity. The current study mainly quantified the contributions of different journals and  
193 countries in the field of lumbar spondylolisthesis. It seemed that SPINE, EUROPEAN SPINE  
194 JOURNAL and JOURNAL OF NEUROSURGERY-SPINE were the prior journals for researchers  
195 to follow or submit their own works, as these three journals were the top 3 productive and the top  
196 3 impact journals in this field. Additionally, other spine-subspecialty journals like SPINE  
197 JOURNAL could be the second-line options, as spine-subspecialty journals were found to be  
198 dominant in productivity and impact of the field. For country/region contributions, USA, China  
199 and Japan have contributed to over half of the publication productivity. However, European  
200 countries seemed to publish more influential articles, as their average article citations were much  
201 higher. It seemed that developed countries/regions tended to produce more articles as well as high  
202 influential articles, as there were only a few non-developed countries/regions among the top 20  
203 productive and the top 20 influential lists. Additionally, researchers may need to focus on USA,  
204 Europe and eastern Asia, if they need collaborations in the field of lumbar spondylolisthesis.

205 Natural language processing (NLP) is a popular research field where human language could  
206 be decoded by machine learning, which has been adopted to analyze academic publications  
207 recently(29). LDA is one of the most widely used machine learning algorithms in NLP(18, 25, 26),  
208 as it is scalable, computationally fast and close to what the human mind assigns while decoding  
209 text words. In the study, publications of Topic 2 remained as the dominant topic from 1990 to  
210 2010, when all kinds of radiographic equipment spread over the world gradually. We assumed that  
211 the widespread of radiographic equipment enabled researchers to pay more attention to lumbar  
212 instability and thus identify key parameters of sagittal balance. These publications (Topic 2) did  
213 improve the knowledge of lumbar spondylolisthesis like classification(30) or sagittal balance(31),  
214 which was of great significance of guiding the management of lumbar spondylolisthesis(32-34).  
215 Publications of Topic 1 kept as the most productive topic after 2010, which could be explained by  
216 the emerging minimally invasive surgical technique and the lack of agreement on the best surgical  
217 approaches(35), as well as the controversy of the addition of fusion to decompression(36).  
218 Publications of Topic 3 gradually became the mainstream topic after 2015, which indicated the  
219 importance of systematic management of lumbar spondylolisthesis. As most spondylolisthesis  
220 patients were asymptomatic and only a few patients seeking treatment will have surgery, doctors  
221 from different subspecialties might hold different viewpoints about best options of nonoperative  
222 treatments, as well as their dosage and progression of physical therapy procedures(6). Failed  
223 conservative treatment would lead to more than double medical costs than those in the  
224 successfully treated cohort(37).

225 While major topics with historical perspective quickly informed potential researchers about  
226 the macroscopic picture of one academic field and how it evolved, recent hotspots might guide the  
227 future researches. The current study identified CBT, OLIF, OLLIF, LLIF, MIS-TLIF, percutaneous  
228 pedicle screw, degenerative lumbar spondylolisthesis, spinal canal stenosis and ASD were the  
229 research hotspots over the past 5 years. Interestingly, most of these hotspots (the first six) belong  
230 to minimally invasive surgical techniques, and all of them were derivatives of internal fixation or

231 fusion technique instead of decompression. It was not a surprise as decompression technique has  
232 developed for decades, but internal fixation and fusion technique could be easily modified with  
233 different approaches and novel devices. Unlike the novel concept of the first six hotspots, spine  
234 physicians or surgeons might not be unfamiliar with degenerative lumbar spondylolisthesis, spinal  
235 canal stenosis and ASD. Degenerative lumbar spondylolisthesis became a hotspot instead of  
236 isthmic spondylolisthesis might be explained by growing aging population and higher prevalence  
237 of lumbar degeneration. Lumbar spondylolisthesis often accompanied by spinal canal stenosis and  
238 ASD is a common complication of spinal fusion, which indicated continuous attentions have been  
239 paid to these traditional problems.

240 Since most hotspots belonged to publications of Topic 1 (surgery), it was necessary to depict  
241 these surgical hotspots in details. CBT, as a caudal-to-rostral and medial-to-lateral pedicle screw  
242 insertion method, has merits of great fixation and pull-out strength even in osteoporosis patients  
243 due to its trajectory goes through cortical bone(38). Thus, CBT became popular in all kinds of  
244 spinal fusion including lumbar spondylolisthesis(39-41). Percutaneous pedicle screw is another  
245 widespread fixation technique with traditional trajectory, but its merits of minimally invasiveness  
246 popularized its utility in OLIF, OLLIF, LLIF and MIS-TLIF etc. OLIF takes an anterior  
247 retroperitoneal approach surgery through a small incision(42). Within the retroperitoneal space,  
248 surgeons will drag the psoas muscle backward, expose the intervertebral space between the psoas  
249 muscle and the abdominal aorta, and then perform decompression plus fusion, which is usually  
250 followed by posterior fixation of percutaneous pedicle screw. OLLIF is another minimally  
251 invasive fusion surgery described by AbbasiH in details in 2015(43). OLLIF uses the classic  
252 YESS endoscopy trajectory technology to establish a working channel, and then enters the  
253 intervertebral disc through Kambin's triangle to complete discectomy and intervertebral fusion  
254 under full-endoscopy(44). LLIF or extreme lateral interbody fusion (XLIF) is another minimally  
255 invasive surgery by bluntly separate the psoas muscle to the lateral side of the intervertebral  
256 space(45, 46). It should be noted that muscle separation may damage the lumbar plexus, so  
257 intraoperative neuromonitoring is required for LLIF/XLIF. MIS-TLIF takes a small paramedial  
258 incision, and the ipsilateral articular process will be excised to expose the intervertebral foraminal  
259 window, through which decompression and fusion are performed(47). It is reported that MIS-TLIF  
260 has become one of the most widespread fusion surgeries(48).

261 The current study may have some limitations. First, we only analyzed articles from the  
262 WoSCC database, so publications not indexed in the WoSCC database were not considered and  
263 citation counts might be underestimated. Second, the study mainly analyzed some useful  
264 information (e.g. abstracts, titles, etc.) of the included publications instead of reviewing full texts.  
265 Last but may not least, as the WoSCC database kept updating and records of 2022 were not  
266 complete, we only analyzed the data by 2021, which might not reflect the most recent trends of  
267 2022.

268

## 269 **Conclusions**

270 The study successfully summarized the productivity and impact of different countries/regions and  
271 journals, which should benefit the journal selection and pursuit of international collaboration for  
272 researcher who were interested in the field of lumbar spondylolisthesis. Publications concerning  
273 emerging surgical technique was the major topic, followed by radiographic measurement and

274 epidemiology for this field. CBT, OLIF, OLLIF, LLIF, MIS-TLIF, percutaneous pedicle screw,  
275 degenerative lumbar spondylolisthesis, spinal canal stenosis and ASD were the research hotspots  
276 of lumbar spondylolisthesis over the past 5 years. With macroscopic plus detailed analysis of  
277 publications concerning lumbar spondylolisthesis, the current study may encourage more  
278 researchers in the field and somewhat inform their research direction in the future.

## 408 **Declarations**

### 409 **Ethics approval and consent to participate**

410 Not applicable.

### 411 **Availability of data and materials**

412 All data generated or analysed during this study are either included in this published article or its  
413 supplementary information fles.

### 414 **Competing interests**

415 Authors declare that there is no conflict of interest regarding the publication of this paper.

### 416 **Funding**

417 Guangdong Basic and Applied Basic Research Foundation (2019A1515111171) and National Natural  
418 Science Foundation of China (82102640) were received in support of this work. The funders had no  
419 role in study design, data collection, data analysis, interpretation, writing of this report and in the  
420 decision to submit the paper for publication.

### 421 **Authors' contributions**

422 G.F. contributed to writing and data interpreting; J.Q. contributed to data analysis; Y.L. contributed to  
423 drafting and data extraction; H.L. and S.Y. contributed to data analysis and critical revisions; X.L. and  
424 S.H. contributed to study design and administration support.

### 425 **Acknowledgements**
