## 29 **Abstract**

30 Objectives: The study aimed to conduct a bibliometric analysis of publications concerning lumbar  
31 spondylolisthesis, as well as explore its research topics and trends with machine-learning based  
32 text mining.

33 Methods: The data were extracted from the Web of Science Core Collection (WoSCC) database  
34 and analyzed in Rstudio1.3.1. Annual publication production and the top 20 productive authors  
35 over time were presented. Additionally, top 20 productive journals and top 20 impact journals  
36 were compared by spine-subspecialty or not. Similarly, top 20 productive countries/regions and  
37 top 20 impact countries/regions were compared by developed countries/regions or not. The  
38 collaborative relationship among countries and the research trends in the past decade were  
39 presented by R package “Bibliometrix”. Latent Dirichlet allocation (LDA) analysis was conducted  
40 to classify main topics of lumbar spondylolisthesis.

41 Results: Up to 2021, a total number of 4990 articles concerning lumbar spondylolisthesis were  
42 finally included for analysis. Spine-subspecialty journals were found to be dominant in  
43 productivity and impact of the field, and SPINE, EUROPEAN SPINE JOURNAL and JOURNAL  
44 OF NEUROSURGERY-SPINE were the top 3 productive and the top 3 impact journals in this  
45 field. USA, China and Japan have contributed to over half of the publication productivity, but  
46 European countries seemed to publish more influential articles. It seemed that developed  
47 countries/regions tended to produce more articles as well as high influential articles, and  
48 international collaborations focused on USA, Europe and eastern Asia. Publications concerning  
49 emerging surgical technique was the major topic, followed by radiographic measurement and  
50 epidemiology for this field. Cortical bone trajectory, oblique lumbar interbody fusion, oblique  
51 lateral lumbar interbody fusion, lateral lumbar interbody fusion, degenerative lumbar  
52 spondylolisthesis, adjacent segment disease, spinal canal stenosis, minimally invasive  
53 transforaminal lumbar interbody fusion and percutaneous pedicle screw were the recent hotspots  
54 over the past 5 years.

55 Conclusions: The study successfully summarized the productivity and impact of different  
56 countries/regions and journals, which should benefit the journal selection and pursuit of  
57 international collaboration for researcher who were interested in the field of lumbar  
58 spondylolisthesis. Additionally, the current study may encourage more researchers in the field and  
59 somewhat inform their research direction in the future.

## 70 **Introduction:**

71 Lumbar spondylolisthesis, especially in the elderly, is one of the most common causes of low  
72 back pain(1). Lumbar spondylolisthesis is defined as a slip of one vertebra over the other beneath,  
73 causing instability of the segment and compression of the cauda equina(2). The incidence of  
74 lumbar spondylolisthesis is 4-6% in the general population(3), which typically occurs in the  
75 occurs at the fourth and fifth lumbar vertebrae(4). In the United States, approximately 11.5% of  
76 the population suffers from this disease(5). Based on its etiology, lumbar spondylolisthesis can be  
77 divided into isthmic or degenerative spondylolisthesis. The former could be post-traumatic  
78 fractures in the pars interarticularis or congenital defects, while the latter is a result of disorders of  
79 the disc space or degenerative arthritis(6). Currently, the risk factors for spondylolisthesis are  
80 considered to be older age, female gender, larger body mass index and sagittal facet orientation(7).

81 According to the current agreement, the treatment of lumbar spondylolisthesis essentially  
82 incorporates conservative treatment or surgical treatment. The nonsurgical treatment options may  
83 include physical therapy, exercise, epidural steroid injections for pain, and medications. If  
84 conservative therapy fails, a surgical intervention was usually recommended(8). Surgical options  
85 include either decompression alone or decompression with fixation and fusion, with the essential  
86 objectives of neural decompression and stability reconstructions as well as restoration of sagittal  
87 alignment(9). Recently, minimally invasive spine surgery has been widely adopted in surgical  
88 management of lumbar spondylolisthesis(10-12). Therefore, probing and summarizing the  
89 research topics or trends of lumbar spondylolisthesis may benefit potential doctors and researchers  
90 who were interested in this field.

91 Bibliometric analysis is a powerful tool to depict the research activities of a certain field in  
92 details(13). For example, bibliometrics analysis can quantify the contribution of a research field  
93 (including different countries, institutions, journals, or authors), and to identify the research trends  
94 or topics in a particular field(14). Nowadays, bibliometric analysis has been widely adopted in  
95 summarizing medical fields, like emerging techniques(15-17) and common disease(18-20). In  
96 spine field, bibliometric studies about cervical myelopathy(21), spinal stenosis(22), spinal cord  
97 injury(23), scoliosis(24) are thriving. However, no bibliometric study concerning lumbar  
98 spondylolisthesis was available. Meanwhile, latent Dirichlet allocation (LDA) is a popular  
99 machine learning algorithm that has been accepted as a bibliometric tool to obtain research topics  
100 for a specific field(25-27). Thus, the purpose of this work is to explore the research topics and  
101 trends of lumbar spondylolisthesis via bibliometric analysis.

102

## 103 **Methods:**

### 104 **Data Acquisition**

105 Relevant literatures were collected from the Web of Science Core Collection (WoSCC) database.  
106 The search terms are “spondylolisthesis”. The time interval was set to 1975 to 2021. Only articles  
107 were included, and no language restrictions were applied. To avoid bias incurred by frequent  
108 database renewal, all literature retrieval and data downloads were completed in a single day, Jan  
109 18, 2022. Considering that data were directly downloaded from the data set, ethical approval was  
110 not required. WoSCC data of full record and references (including titles, countries of origin,

111 institutions, journals, authors, etc.) were extracted in bib format and then imported into the  
112 Rstudio1.3.1. for bibliometric analysis.

### 113 **Quantitative analysis**

114 Annual publication production and the top 20 productive authors over time were presented.  
115 Additionally, top 20 productive journals and top 20 impact journals were compared by  
116 spine-subspecialty or not. Similarly, top 20 productive countries/regions and top 20 impact  
117 countries/regions were compared by developed countries/regions or not. The productivity of  
118 journals and countries/regions was measured by the total number of publications, whereas the  
119 impact of journals and countries/regions was assessed by H-index or average article citations (15).  
120 H-index was characterized as the extent that an entity has published at least h papers that have  
121 been each cited at least h times (28). All the data were analyzed by Rstudio1.3.1 and R package  
122 “Bibliometrix” was used to conduct quantitative analysis of different entity’s contributions.

### 123 **Research topics and trends**

124 LDA can create a vocabulary of terms and then classify the included publications into different  
125 topics(18). We used the package “lda” in R language to conduct LDA analysis of included  
126 abstracts. The collaborative relationship among countries and the research trend in the past decade  
127 were presented by R package “Bibliometrix”.

128

## 129 **Results**

### 130 **General information**

131 Up to 2021, a total number of 4990 articles concerning lumbar spondylolisthesis were finally  
132 included for analysis. Average citations per documents reached 24.43, and average citations per  
133 year per documents reached 1.829. A total of 623 sources were identified while most sources were  
134 academic journals, as only a few articles were book chapters. Annual published articles  
135 concerning lumbar spondylolisthesis kept rising over time (**Figure 1**), and the publications of the  
136 latest 10 years contributed to 56.9% (2841/4990) productivity of this field. Similarly, almost all  
137 the top 20 productive authors published most of their articles concerning lumbar spondylolisthesis  
138 in years between 2010 and 2020.

### 139 **Quantitative analysis**

140 The top 20 productive journals and the top 20 impact journals publishing articles concerning  
141 lumbar spondylolisthesis were listed in **Table 1**. Articles in the top 20 journals (2789) were equal  
142 to 55.89% of all 4990 article publications. “SPINE” was the most productive journal (750 articles)  
143 and the most influential journal (H-index: 102) in the field. Similarly, “EUROPEAN SPINE  
144 JOURNAL” was the second productive (361 articles) and the second influential journal (H-index:  
145 49), while “JOURNAL OF NEUROSURGERY-SPINE” was the third productive (255 articles)  
146 and the third influential journal (H-index: 47). Most articles (1952/2789) were published by  
147 spine-subspecialty journals among the top 20 productive journals, even though only 9  
148 spine-subspecialty journals were in the top 20 productive lists. The top 3 influential journals all  
149 belonged to spine-subspecialty journals, although only one third of the top 20 influential journals

150 were spine-subspecialty journals (7/20).

151 The top 20 productive and top 20 impact countries/regions publishing articles concerning  
152 lumbar spondylolisthesis were listed in **Table 2**. Articles in the top 20 countries/regions (4468)  
153 were equal to 89.54% of all 4990 article publications. USA was the most productive country (1570  
154 articles) in this field, followed by China (536 articles) and Japan (531 articles). It was noted that  
155 Taiwan, as one of the most developed regions in China, accounted for nearly 20% of China's  
156 productive contributions. However, only three non-developed countries were in the top 20  
157 productive list, while developed countries/regions published 86.01% (3843/4468) articles among  
158 the top 20 productive lists. As we ranked the top impact countries/regions by average article  
159 citations, USA only ranked top 7 and Japan ranked top 16, while China was even not in the top 20  
160 influential list. Among this list, only one country belonged to non-developed economic entity.

161 Collaborations among countries/regions and institutions in lumbar spondylolisthesis field  
162 were presented in **Figure 2**. Countries or region connected with red lines indicated there were  
163 some collaborations among them and the thickness of the red line was proportional to the number  
164 of collaborations. It seemed that USA was the hub country of publications, because there are lots  
165 of red lines radiated from USA to European countries, China, Korea, Japan and even Australia.  
166 Although India, Brazil, China, Japan and some middle eastern countries were also productive,  
167 there were little collaborations among them. As for institution collaboration, University of  
168 California-San Francisco was the most active institution in this field. It seemed that most active  
169 institutions in collaborations were from USA, followed by South Korea, and Canada. Although  
170 China was one of the most productive country, only two intuitions from Taiwan Province were  
171 recognized as the most active institutions in collaborations.

## 172 **Research topics and trends**

173 After removing articles without abstracts, a total of 4581 articles were finally included for LDA  
174 analysis. We found three major topics in this field, and named them as “Topic 1: surgery”, “Topic  
175 2: radiology” and “Topic 3: epidemiology” (**Figure 3**). The publication proportion of these three  
176 topics were 37.2%, 34.3% and 28.5%, respectively. Additionally, we presented how the  
177 productivity of these three topics evolved over time. It seemed that one third of publications were  
178 concerned about the radiographic measurement of lumbar spondylolisthesis (Topic 2: radiology),  
179 and it kept as the most productive topic for two decades (1990 to 2010). After 2010, publications  
180 concerning all kinds of surgical management (Topic 1: surgery) became the dominant topic, and  
181 publications concerning prevalence, risk factors, quality of life and conservative treatment of  
182 lumbar spondylolisthesis (Topic 3: epidemiology) joined as another mainstream topic after 2015.

183 Using term frequency, we obtained the research trends of lumbar spondylolisthesis over the  
184 past one decade (**Figure 4**). Cortical bone trajectory (CBT), oblique lumbar interbody fusion  
185 (OLIF), oblique lateral lumbar interbody fusion (OLLIF), lateral lumbar interbody fusion (LLIF),  
186 degenerative lumbar spondylolisthesis, adjacent segment disease (ASD), spinal canal stenosis,  
187 minimally invasive transforaminal lumbar interbody fusion (MIS-TLIF) and percutaneous pedicle  
188 screw were the recent hotspots over the past 5 years.

189

## 190 Discussion

191 Text mining and bibliometric analysis have been adopted widely in depicting a certain  
192 academic field in details. The current study quantified different entities' academic contributions to  
193 lumbar spondylolisthesis, as well as provided an in-depth and visualized analysis of its topics and  
194 trends. To the best of our knowledge, this was the first bibliometric analysis of lumbar  
195 spondylolisthesis, which might help researchers gain a basic understanding, develop areas of focus  
196 and pursue further practice in this field.

197 Academic contributions of one field could be quantified by publication productivity and  
198 citation activity. The current study mainly quantified the contributions of different journals and  
199 countries in the field of lumbar spondylolisthesis. It seemed that SPINE, EUROPEAN SPINE  
200 JOURNAL and JOURNAL OF NEUROSURGERY-SPINE were the prior journals for researchers  
201 to follow or submit their own works, as these three journals were the top 3 productive and the top  
202 3 impact journals in this field. Additionally, other spine-subspecialty journals like SPINE  
203 JOURNAL could be the second-line options, as spine-subspecialty journals were found to be  
204 dominant in productivity and impact of the field. For country/region contributions, USA, China  
205 and Japan have contributed to over half of the publication productivity. However, European  
206 countries seemed to publish more influential articles, as their average article citations were much  
207 higher. It seemed that developed countries/regions tended to produce more articles as well as high  
208 influential articles, as there were only a few non-developed countries/regions among the top 20  
209 productive and the top 20 influential lists. Additionally, researchers may need to focus on USA,  
210 Europe and eastern Asia, if they need collaborations in the field of lumbar spondylolisthesis.

211 Natural language processing (NLP) is a popular research field where human language could  
212 be decoded by machine learning, which has been adopted to analyze academic publications  
213 recently(29). LDA is one of the most widely used machine learning algorithms in NLP(18, 25, 26),  
214 as it is scalable, computationally fast and close to what the human mind assigns while decoding  
215 text words. In the study, publications of Topic 2 remained as the dominant topic from 1990 to  
216 2010, when all kinds of radiographic equipment spread over the world gradually. We assumed that  
217 the widespread of radiographic equipment enabled researchers to pay more attention to lumbar  
218 instability and thus identify key parameters of sagittal balance. These publications (Topic 2) did  
219 improve the knowledge of lumbar spondylolisthesis like classification(30) or sagittal balance(31),  
220 which was of great significance of guiding the management of lumbar spondylolisthesis(32-34).  
221 Publications of Topic 1 kept as the most productive topic after 2010, which could be explained by  
222 the emerging minimally invasive surgical technique and the lack of agreement on the best surgical  
223 approaches(35), as well as the controversy of the addition of fusion to decompression(36).  
224 Publications of Topic 3 gradually became the mainstream topic after 2015, which indicated the  
225 importance of systematic management of lumbar spondylolisthesis. As most spondylolisthesis  
226 patients were asymptomatic and only a few patients seeking treatment will have surgery, doctors  
227 from different subspecialties might hold different viewpoints about best options of nonoperative  
228 treatments, as well as their dosage and progression of physical therapy procedures(6). Failed  
229 conservative treatment would lead to more than double medical costs than those in the  
230 successfully treated cohort(37).

231 While major topics with historical perspective quickly informed potential researchers about  
232 the macroscopic picture of one academic field and how it evolved, recent hotspots might guide the

233 future researches. The current study identified CBT, OLIF, OLLIF, LLIF, MIS-TLIF, percutaneous  
234 pedicle screw, degenerative lumbar spondylolisthesis, spinal canal stenosis and ASD were the  
235 research hotspots over the past 5 years. Interestingly, most of these hotspots (the first six) belong  
236 to minimally invasive surgical techniques, and all of them were derivatives of internal fixation or  
237 fusion technique instead of decompression. It was not a surprise as decompression technique has  
238 developed for decades, but internal fixation and fusion technique could be easily modified with  
239 different approaches and novel devices. Unlike the novel concept of the first six hotspots, spine  
240 physicians or surgeons might not be unfamiliar with degenerative lumbar spondylolisthesis, spinal  
241 canal stenosis and ASD. Degenerative lumbar spondylolisthesis became a hotspot instead of  
242 isthmic spondylolisthesis might be explained by growing aging population and higher prevalence  
243 of lumbar degeneration. Lumbar spondylolisthesis often accompanied by spinal canal stenosis and  
244 ASD is a common complication of spinal fusion, which indicated continuous attentions have been  
245 paid to these traditional problems.

246 Since most hotspots belonged to publications of Topic 1 (surgery), it was necessary to depict  
247 these surgical hotspots in details. CBT, as a caudal-to-rostral and medial-to-lateral pedicle screw  
248 insertion method, has merits of great fixation and pull-out strength even in osteoporosis patients  
249 due to its trajectory goes through cortical bone(38). Thus, CBT became popular in all kinds of  
250 spinal fusion including lumbar spondylolisthesis(39-41). Percutaneous pedicle screw is another  
251 widespread fixation technique with traditional trajectory, but its merits of minimally invasiveness  
252 popularized its utility in OLIF, OLLIF, LLIF and MIS-TLIF etc. OLIF takes an anterior  
253 retroperitoneal approach surgery through a small incision(42). Within the retroperitoneal space,  
254 surgeons will drag the psoas muscle backward, expose the intervertebral space between the psoas  
255 muscle and the abdominal aorta, and then perform decompression plus fusion, which is usually  
256 followed by posterior fixation of percutaneous pedicle screw. OLLIF is another minimally  
257 invasive fusion surgery described by AbbasiH in details in 2015(43). OLLIF uses the classic  
258 YESS endoscopy trajectory technology to establish a working channel, and then enters the  
259 intervertebral disc through Kambin's triangle to complete discectomy and intervertebral fusion  
260 under full-endoscopy(44). LLIF or extreme lateral interbody fusion (XLIF) is another minimally  
261 invasive surgery by bluntly separate the psoas muscle to the lateral side of the intervertebral  
262 space(45, 46). It should be noted that muscle separation may damage the lumbar plexus, so  
263 intraoperative neuromonitoring is required for LLIF/XLIF. MIS-TLIF takes a small paramedial  
264 incision, and the ipsilateral articular process will be excised to expose the intervertebral foraminal  
265 window, through which decompression and fusion are performed(47). It is reported that MIS-TLIF  
266 has become one of the most widespread fusion surgeries(48).

267 The current study may have some limitations. First, we only analyzed articles from the  
268 WoSCC database, so publications not indexed in the WoSCC database were not considered and  
269 citation counts might be underestimated. Second, the study mainly analyzed some useful  
270 information (e.g. abstracts, titles, etc.) of the included publications instead of reviewing full texts.  
271 Last but may not least, as the WoSCC database kept updating and records of 2022 were not  
272 complete, we only analyzed the data by 2021, which might not reflect the most recent trends of  
273 2022.

274

## 275 **Conclusions**

276 The study successfully summarized the productivity and impact of different countries/regions and  
277 journals, which should benefit the journal selection and pursuit of international collaboration for  
278 researcher who were interested in the field of lumbar spondylolisthesis. Publications concerning  
279 emerging surgical technique was the major topic, followed by radiographic measurement and  
280 epidemiology for this field. CBT, OLIF, OLLIF, LLIF, MIS-TLIF, percutaneous pedicle screw,  
281 degenerative lumbar spondylolisthesis, spinal canal stenosis and ASD were the research hotspots  
282 of lumbar spondylolisthesis over the past 5 years. With macroscopic plus detailed analysis of  
283 publications concerning lumbar spondylolisthesis, the current study may encourage more  
284 researchers in the field and somewhat inform their research direction in the future.

## 414 **Declarations**

## 415 **Ethics approval and consent to participate**

416 Not applicable.

## 417 **Availability of data and materials**

418 All data generated or analysed during this study are either included in this published article or its  
419 supplementary information fles.

## 420 **Competing interests**

421 Authors declare that there is no conflict of interest regarding the publication of this paper.

## 422 **Funding**

423 Guangdong Basic and Applied Basic Research Foundation (2019A1515111171) and National Natural  
424 Science Foundation of China (82102640) were received in support of this work. The funders had no  
425 role in study design, data collection, data analysis, interpretation, writing of this report and in the  
426 decision to submit the paper for publication.

## 427 **Authors' contributions**

428 G.F. contributed to writing and data interpreting; J.Q. contributed to data analysis; Y.L. and S.Y.  
429 contributed to drafting and data extraction; H.L. and L.H. contributed to data analysis and critical  
430 revisions; X.L. and S.H. contributed to study design and administration support.

## 431 **Acknowledgements**
