11 †Zhong-Ning He, Ming-Wan Su, Jie-He Guang-hui Zhu and Yu-Wei Zhao share co-first author.

12 **Purpose** To evaluate the efficacy and safety of Chinese herbal injection thoracic perfusion combined
13 with cisplatin chemotherapy for lung cancer patients with MPE.

14 **Method** Eight databases were searched for articles published from inception to August 20, 2022 for
15 randomized-controlled trials (RCTs) that are relevant. The included studies were reviewed by two
16 investigators, with relevant data extracted independently. Primary outcome was identified as
17 objective response rate (ORR), while secondary outcomes were identified as quality of life (QOL)
18 and adverse reactions. Quality of the included trials was assessed through risk of bias assessment of
19 the Cochrane risk-of-bias tool. The Revman5.3 and Stata17.0 software were used to calculate risk
20 ratio (RR) at 95% confidence intervals (CI) for binary outcomes.

21 **Results** 29 RCTs involving 1887 patients were included in this study. Compared with patients treated
22 with cisplatin thoracic perfusion alone, those with Chinese herbal injection and cisplatin thoracic
23 perfusion had better therapeutic effects (RR=1.44, 95% CI: 1.35~1.53, P = 0.000), higher KPS score
24 (RR = 1.47, 95%CI: 1.34~1.61, P = 0.0000), lower digestive tract reaction(RR = 0.56, 95%CI:
25 0.48~0.67, P = 0.000) , bone marrow suppression (RR = 0.50, 95% CI: 0.43~0.59, P =0.000) and
26 chest pain reactions (RR = 0.65, 95%CI: 0.47~0.89, P = 0.007).

27 **Conclusion** The systematic review indicated that Chinese herbal injection thoracic perfusion
28 combined with cisplatin chemotherapy may improve therapeutic effect, quality of life, and reduce
29 adverse reactions. More large-scale and higher quality RCTs are warranted to support our findings.
30 Systematic Review Registration: PROSPERO, identifier CRD42022347345.

31 **Keywords:** Chinese Herbal, lung cancer, malignant pleural effusion, cisplatin , thoracic perfusion,
32 systematic review, meta-analysis

33 **1 Introduction**

34 Lung cancer is one of the most common malignant tumors in the world, with high morbidity and
35 mortality^[1], Malignant Pleural Effusion (MPE) is a common complication in lung cancer patients.
36 and the median survival time is only 5.5 months^[2]. The occurrence of MPE is associated with poor
37 quality of life (QOL) and shorter survival time in lung cancer patients^[3]. Thus, effective treatment for
38 MPE appears very important. The main purpose is to control the effusion from growth, relieve
39 dyspnea, improve the quality of survival, to extend the survival. Currently, management options for
40 MPE includes chest tube drainage and systematic chemotherapy to achieve symptomatic relief and
41 controlling the primary malignancies. Thoracic perfusion of chemotherapeutic is an effective method
42 for the treatment of MPE, and thoracic perfusion of cisplatin has good pharmacodynamics^[4, 5], high
43 economic practicability^[6]. However, the side effects of cisplatin, such as gastrointestinal reactions

44 and hepatorenal toxicity, cannot be ignored, and will affect the quality of life of patients to a certain
45 extent^[7]. Therefore, current management approach remain palliative. Thus, we seek to find an
46 effective combined treatment for MPE. In recent years, related studies have shown that anti-tumor
47 Chinese herbal injection thoracic perfusion combined with cisplatin chemotherapy in the treatment of
48 MPE have a positive effect in improving efficiency, improve the quality of life, reduce adverse
49 reactions^[8-10]. Although the clinical studies on Chinese herbal injection in the treatment of lung
50 cancer MPE are increasing, the long-term efficacy has not been measured. Lack of high quality, neat
51 standard clinical research, In order to obtain higher evidence data, this study using evidence-based
52 medicine method, comprehensive collection published in Chinese and English literature at present,
53 the systematic evaluation of Chinese herbal injection thoracic perfusion combined with cisplatin
54 chemotherapy of lung cancer MPE, curative effect in order to provide a basis for evidence based
55 medicine in the future clinical treatment.

56 **2 METHODS**

57 This study was conducted following the Preferred Reporting Items for Systematic Reviews and
58 Meta-Analyses (PRISMA) guidelines^[11]. The protocol has been registered in PROSPERO
59 (registration number: CRD42022347345).

60 **3 Search strategy**

61 An independent review of citations was searched for articles published from inception to August 20,
62 2022, relevant publications evaluating the efficacy and safety of Chinese herbal injection for Lung
63 cancer with MPE were searched in the Chinese National Knowledge Infrastructure (CNKI), Wanfang
64 Database, the VIP Information Database, Chinese Biomedical Literature database (CBM), PubMed,
65 EMBASE, and the Cochrane Library. The following Key words were used: “Lung Neoplasms OR
66 Lung Cancer” AND “Pleural Effusion, Malignant OR Malignant Pleural Effusion” AND “Cisplatin”

67 AND “Elemene injection OR Kushen injection OR Kanglaite injection OR Brucea Javanica oil
68 emulsion OR Yuxingcao injection OR Aidi injection OR Xiao-ai-ping injection OR Huachansu
69 injection OR Shenqifuzheng injection OR Kang-Ai injection OR Kushenhuangqi injection”. All
70 retrievals were implemented using MeSH and free words (the detailed search strategy is available in
71 Supplementary 1). The languages were restricted to Chinese and English.

72 **4 Study selection and data extraction**

73 Eligible studies were randomized controlled trials of lung cancer adults (≥ 18) with MPE
74 involving Chinese herbal injection thoracic perfusion combined with cisplatin chemotherapy
75 comparing to cisplatin thoracic perfusion alone. We defined intervened injections as Elemene
76 injection, Kushen injection, Kanglaite injection, Brucea Javanica oil emulsion, Yuxingcao injection,
77 Aidi injection, Xiao-ai-ping injection, Huachansu injection, Shenqifuzheng injection, Kang-Ai
78 injection, Kushenhuangqi injection etc. Studies were excluded if patients were treated with other
79 chemotherapy.

80 Two reviewers Ming-Wan Su and Jie-He independently selected studies based on the inclusion and
81 exclusion criteria described above. Two reviewers independently extracted details for each trial: first
82 author name and year of publication, patient characteristics; Intervention: Chinese herbal injection,
83 Cisplatin ingredients, dose, treatment time; primary and secondary outcome measures. Missing
84 information can be obtained by contacting the author.

85 **5 Data synthesis and analysis**

86 The primary outcome measure is objective remission rate (ORR) of MPE which was defined as CR +
87 PR^[12]. Quality of life (QOL) evaluated with Karnofsky score. Adverse events (digestive tract
88 reactions, bone marrow suppression, chest pain) are second outcome measures. The data were
89 processed and analyzed by Stata 17.0 (Stata Corp, College Station, SE). Random-effects models were

90 performed to calculate pooled effects. Fixed-effect models were performed if statistical heterogeneity
91 was absent (heterogeneity test, $P \geq 0.10$), dichotomous data were presented as pooled Risk Ratio
92 (RR) with 95% confidence intervals (95% CIs), Assessment of heterogeneity was performed using
93 Cochran's Q test and Higgins's I^2 ; $I^2 > 50\%$ and a P value < 0.10 suggested significant
94 heterogeneity^[13]. Sensitivity analysis was performed by sequentially omitting each study to examine
95 the robustness of the results. Potential publication bias was evaluated using Begg's funnel plot and
96 Egger's test^[14].

97 **6 Risk of Bias Assessment**

98 Two reviewers Zhong-Ning He and Guang-Hui Zhu independently assessed the quality of the
99 selected trials according to the RCT trials tool of the Cochrane Collaboration. Items were divided
100 into three categories: low risk bias, unclear bias and high-risk bias. The following features are
101 random sequence generation (selection bias), concealment of assignment (selection bias), blinding of
102 participants, personnel (performance bias), outcome data were incomplete (attrition bias), selective
103 reporting (reporting bias), and other bias. These assessments are plotted and evaluated using Review
104 Manager 5.3.

105 **7 Result**

106 **7.1. Search Result**

107 Initially 281 literatures from 7 electronic databases were identified. After the removal of 98
108 duplications and 55 irrelevants after screening through the title and abstract, 43 articles were consider
109 potentially appropriate for inclusion. Among which, 14 articles were excluded for the following
110 reasons: not lung cancer patient (n=2), not thoracic perfusion (n=4), Chinese herbal injection
111 intervention alone (n=6), Chinese herbal injection with other chemotherapy (n=2). Eventually, 29

112 single-centered RCTs met all inclusion criteria,^[8-10, 15-40] as shown in the flow diagram (Locate Figure
 113 1)

114 **Figure 1** | Flow diagram

115 **7.2. Characteristics of the Included Studies**

116 All 29 studies yielded a total of 1,887 patients. The baseline characteristics of each trial are presented
 117 in Table 1. The control group was treated with cisplatin thoracic perfusion, on the basis of the control
 118 group, the experimental group was infused with chinese herbal injection. 29 trials reported the ORR
 119 following WHO guidelines, KPS was reported in 16 studies, and adverse events were reported in 24
 120 studies, Among the 29 citations, intervention of experimental group was Aidi injection in 12
 121 studies^[10, 18, 21, 24, 26, 30-32, 35-38], Kushen injection in 10 studies^[8, 16, 17, 20, 22, 25, 27, 33, 34, 40], Brucea
 122 Javanica oil emulsion in 3 studies^[9, 29, 39], and other injections were not included because less than 3
 123 studies. A total of 16 studies reported QOL improvement (the number of patients KPS score 10
 124 points higher or stable after treatment)^[8, 9, 15, 16, 21, 22, 24-27, 29, 33, 34, 36, 37, 39]. 24 studys that included
 125 1,527 patients reported adverse reactions^[8, 9, 16-27, 29, 31-39]. Bone marrow suppression was recorded in
 126 23 studies^[8, 9, 16-21, 23-27, 29-32, 34-39, 41]. 19 studys that included 1,353 patients reported chest pain^{[9, 15, 16,}
 127 ^{18-24, 26, 29, 31-33, 35, 37-39]}.

 131 reaction; O4, Bone marrow suppression; O5, Chest pain

132 7.3. Study quality and Risk of bias

133 Among all studies included, 24 used random assignment^[8-10, 15-17, 19-29, 31, 32, 34-36, 38, 39], and seven of
 134 them reported the way assignments were hidden^[15, 19, 22, 25, 31, 32, 35]. In terms of blind implementation,
 135 none of the studies mentioned it. Two of the included studies may have had incomplete data records,
 136 which have no effect on the results of the study^[20, 40], for reasons not explained in the report. In
 137 terms of selective reporting of outcomes, all studies reported treatment from two or more aspects,
 138 with a low risk of reporting bias. In terms of other biases, 2 treatment methods of the experimental
 139 groups were not exclusively described in 2 studies, which may have other biases^[15, 38]. Figure 2
 140 shows more details. (LocateFigure2)

141 **Figure 2** | Risk of bias summary and diagram. (A) Risk of bias summary. (B) Risk of bias diagram.

142 7.4. Primary outcomes

143 7.4.1 Objective Remission Rate (ORR)

144 Comparing to cisplatin thoracic perfusion, the ORR favored Chinese herbal injection group
 145 (RR=1.44, 95% CI: 1.35~1.53, $P = 0.000$; $I^2 = 38.4%$, $P = 0.020$). (LocateFigure 3)

146 **Figure 3** | forest plot of ORR

147 **7.5. Secondary outcomes**

148 **7.5.1 Quality of Life (QOL)**

149 Compared with cisplatin thoracic perfusion alone, Chinese herbal injection thoracic perfusion
150 combined with cisplatin chemotherapy could significantly improve the KPS scores (RR = 1.47,
151 95%CI: 1.34~1.61, $P = 0.0000$), with low heterogeneity ($I^2 = 0\%$, $P = 0.943$), and there was a
152 statistical difference between the two groups. (LocateFigure 4)

153 **Figure 4** | Meta-analysis of QOL

154 **7.5.2 Digestive tract reaction**

155 Comparing to cisplatin thoracic perfusion, Chinese herbal injection thoracic perfusion combined with
156 cisplatin chemotherapy significantly reduced the incidence of digestive tract reactions (RR = 0.56,
157 95%CI: 0.48~0.67, $P = 0.000$) with low heterogeneity ($I^2 = 27.5\%$, $P = 0.106$). (LocateFigure 5)

158 **Figure 5** | Meta-analysis of digestive tract reaction

159 **7.5.3 Bone marrow suppression**

160 The incidence of bone marrow depressions in experimental group was significantly lower than that in
161 control group (RR = 0.50, 95% CI: 0.43~0.59, $P = 0.000$) with low heterogeneity ($I^2 = 8.9\%$, $P =$
162 0.340). (LocateFigure 6)

163 **Figure 6** | Meta-analysis of bone marrow suppression

164 **7.5.4 Chest pain**

165 The experimental group significantly reduced the incidence of chest pain reactions (RR = 0.65,
166 95%CI: 0.47~0.89, $P = 0.007$), with low heterogeneity ($I^2 = 0\%$, $P = 0.631$). (LocateFigure 7)

167 **Figure 7** | Meta-analysis of Chest pain

168 **7.6 Subgroup analysis of QOL and Adverse reactions**

169 Among the 5 secondary outcome measures, subgroup analysis was performed according to the
170 difference of Chinese herbal injections. The results of subgroup analysis are shown in Table 2.

171 Compared with cisplatin thoracic perfusion alone, Aidi injection, Kushen injection, Brucea Javanica
172 oil emulsion combined with cisplatin thoracic perfusion in the treatment of MPE has a better
173 therapeutic effect in QOL, digestive tract reaction, and bone marrow suppression outcome, and the
174 differences are statistically significant, the results of subgroup analysis were consistent with the trend
175 of the overall combined results. But there was no statistically significant difference in the outcome
176 index of chest pain, which was different from the overall combined trend. (Table2)

177 **Table 2** results of subgroup analysis

Outcome	Pooled RR(95%CI)	Z	P	Heterogeneity	
				I ² (%)	P _h
Quality of Life (QOL)	1.52(1.37,1.69)	8.05	0.000	0%	0.998
Digestive tract reaction	0.53(0.43,0.64)	6.37	0.000	27.9%	0.111

Bone marrow suppression	0.52(0.44,0.61)	7.60	0.000	8.6%	0.346
Chest pain	0.82(0.54,1.25)	0.93	0.35	0%	0.729

178 **7.7 Moderator effects**

179 To investigate the sources of potential heterogeneity, we conducted subgroup analysis with
 180 moderator variables include injection categories, According to the results of subgroup analysis in
 181 Figure 8, it can be concluded that Aidi injection combined with cisplatin thoracic perfusion
 182 (RR=1.37, 95%CI: 1.25~1.50, $P = 0.000$, $I^2 = 58.3%$, $P=0.006$), Kushen injection combined with
 183 cisplatin thoracic perfusion (RR = 1.48, 95%CI: 1.32~1.66, $P = 0.000$, $I^2 = 0%$, $P=0.813$). Brucea
 184 Javanica oil emulsion combined with cisplatin thoracic perfusion was infused into the chest (RR =
 185 1.68, 95%CI: 1.34~2.09, $P = 0.000$, $I^2 = 0%$, $P=0.964$). Compared with cisplatin thoracic perfusion
 186 alone, all of them have more effective rate in the treatment of MPE, and the difference is statistically
 187 significant. Therefore, the results of the subgroup analysis on ORR, the primary outcome measure,
 188 were trend consistent with the overall pooled results (RR = 1.45, 95%CI: 1.35~1.55, $P = 0.000$, $I^2 =$
 189 45.2%, $P=0.008$). (LocateFigure8)

190 **Figure 8 | Subgroup analysis of ORR**

191 **7.8 Sensitivity analysis**

192 In this study, sensitivity analysis was conducted leave-one-out method, revealing that Hou TJ^[18] had
193 a rather great impact on heterogeneity. After the elimination, I^2 decreased from 38.4% to 0%, but had
194 little effect on the final results (RR=1.44, 95% CI: 1.35~1.53, $P = 0.000$ vs RR:1.47, 95%CI:
195 1.37~1.56, $P = 0.0000$). There was a certain heterogeneity in subgroup analysis of ORR ($I^2 = 45.2\%$).
196 After deleting the study of Hou TJ^[18], I^2 decreased from 45.2% to 0%, but had little effect on the
197 final results (RR = 1.42, 95%CI: 1.30~1.55, $P = 0.000$ vs RR:1.40, 95%CI: 1.31~1.50, $P = 0.0000$).
198 (Figure 9A-B). Compared with other research, Hou TJ had a relatively high response rate, so as to
199 tilting the heterogeneity much heavier. For second outcome: Quality of life (QOL), digestive tract
200 reaction, bone marrow suppression and chest pain, outcome indicators found that the heterogeneity
201 among studies was small ($I^2 < 30\%$), and the inclusion of one study by one had little impact on the
202 results, so these results were stable (LocateFigure 9).

203 **Figure 9** | (A) sensitivity analysis of ORR; (B) sensitivity analysis of Subgroup analysis of ORR; (C)
204 sensitivity analysis of QOL; (D) sensitivity analysis of digestive tract reaction; (E) sensitivity
205 analysis of bone marrow suppression; (F) sensitivity analysis of chest pain

206 **7.9 Publication bias**

207 Funnel plots were drawn according to the primary outcome measure ORR, we noticed that the
208 included study was distributed asymmetrically on both sides of the funnel chart (Figures 10A–C),
209 indicating that there was significant publication bias in the meta-analysis. The Begg ($p=0.003$) and
210 Egger ($p=0.000$) test was used to test the publication bias of 29 studies included in this meta-analysis,
211 and the results showed that this study had obvious publication bias ($P<0.05$). The 29 articles included
212 in this study were analyzed by the trim-fill method, and the results showed that after the inclusion of
213 14 virtual studies, Meta-analysis was conducted again, using the fixed effect model, and the
214 combined results of effect indicators RR=1.229, 95%CI :1.171~1.289, although some small sample

215 studies were added to correct the publication bias, which did not have a significant impact on the
216 results. (LocateFigure10)

217 **Figure 10** | (A) Funnel plot of ORR; (B) Egger test of ORR; (C) Begg test of ORR; (D) trim-fill
218 method of ORR

219 **8 Discussion**

220 The aim of this meta-analysis is to evaluate the efficacy and safety of Chinese herbal injection
221 thoracic perfusion combined with cisplatin chemotherapy in the treatment of lung cancer MPE.
222 Compared with the published meta-analysis^[42], our study is the first to control the administration
223 mode of traditional Chinese herbal injection as thoracic perfusion, using thoracic perfusion of
224 cisplatin as the control group, which ensures the consistency of intervention measures and can reduce
225 clinical heterogeneity to a certain extent. Our results demonstrated that Chinese herbal injection
226 thoracic perfusion combined with cisplatin chemotherapy can improve the ORR of lung cancer
227 patients with MPE (RR=1.44, 95% CI: 1.35~1.53, $P = 0.000$). In addition, we also performed
228 subgroup analysis according to different Chinese herbal injection. The results showed that compared
229 with cisplatin thoracic perfusion alone, Aidi injection, Kushen injection and Brucea Javanica oil
230 emulsion could improve the ORR of lung cancer patients with MPE.

231 As we all know, lung cancer patients with MPE will have symptoms of chest pain due to poor water
232 circulation. Chemotherapy drugs will inhibit the hematopoietic function of bone marrow, and also
233 affect the digestive function of patients, with vomiting, diarrhea and other digestive tract reactions,
234 further affecting the quality of life of patients. In terms of quality of life, our results showed that
235 Chinese herbal injection could effectively improve the quality of life of patients with lung cancer
236 MPE, and the results of subgroup analysis were consistent with the total results. In addition, Chinese
237 herbal injection thoracic perfusion combined with cisplatin chemotherapy can effectively improve the

238 digestive tract reaction and bone marrow suppression of patients, and the results are statistically
239 significant and consistent with the results of subgroup analysis. Chinese herbal injection thoracic
240 perfusion combined with cisplatin chemotherapy can alleviate chest pain in patients, but the results of
241 subgroup analysis showed no statistical significance, which may be related to the small sample size
242 included in the study. We should consider focusing on this adverse reaction in the future.

243 Although funnel plots for the 29 studys showed that there was significant publication bias in the
244 meta-analysis, there is no significant difference between the results of trim-fill method and the
245 original data, which is favorable to our existing results

246 Our study also have certain limitations, which increase the risk of bias in the outcome indicators of
247 this study. First of all, although this study adopted a relatively extensive search strategy, some
248 conference papers, supplements and grey literature may not be fully obtained, so potential publication
249 bias cannot be excluded. The funnel plot and Begg and Egger test results also reflect some potential
250 publication bias. Among the 29 included studies, only 7 studies described the method of
251 randomization, while the remaining studies did not explain the method of randomization and
252 allocation concealment, and no study mentioned the blinding method, which may lead to potential
253 performance bias and selection bias. Secondly, the sample size of all the included studies was
254 generally small, and the efficacy of the subjects was not tracked. The intervention measures,
255 intervention time and drug administration plan of all the studies were not completely unified, and the
256 forms and effectiveness of the intervention mechanisms could not be clarified. It may increase the
257 imprecision of the outcome indicators and make the evidence strength of the outcome indicators low.
258 Finally, important clinical survival outcomes such as overall survival, progression-free survival, and
259 5-year survival were not fully reported in the included studies. Therefore, high quality and large
260 sample clinical studies are needed in the future to further evaluate the efficacy and safety of Chinese

261 herbal injection thoracic perfusion combined with cisplatin chemotherapy in the treatment of lung
262 cancer MPE, and provide more evidence to support our findings.

263 **9 Conclusion**

264 Our study demonstrated the potencies of Chinese herbal injection thoracic perfusion combined with
265 cisplatin chemotherapy to enhance the efficacy and safety for lung cancer MPE patients, improve
266 quality of life and decrease adverse reactions. Furthermore, the long-term efficacy of Chinese herbal
267 injection in Lung cancer MPE treatment still needs to be verified in future well-designed clinical
268 trials that adhere to CONSORT guidelines. More efforts are needed to promote the application of
269 Chinese herbal injection in the clinic.
