21 **ABSTRACT**

22

23 **Introduction**

24 Cultural competence is an important attribute underpinning interactions between healthcare
25 professionals, such as pharmacists, and patients from ethnic minority communities. Health- and
26 medicines-related inequalities affecting people from underrepresented ethnic groups, such as
27 poorer access to healthcare services and poorer overall treatment outcomes in comparison to their
28 White counterparts, have been widely discussed in existing literature. Community pharmacies are a
29 first port of call healthcare service accessed by diverse patient populations; yet, limited research
30 exists which explores the perceptions of culturally competent care within the profession, or the
31 delivery of cultural competence training to community pharmacy staff. This research seeks to gather
32 perspectives of community pharmacy teams relating to cultural competence and identify possible
33 approaches for the adoption of cultural competence training.

34

35 **Methods**

36 Semi-structured interviews were conducted in-person, over the telephone or *via* video call, between
37 October-December 2022. Perspectives on cultural competence and training were discussed.
38 Interviews were audio-recorded and transcribed verbatim. Reflexive thematic analysis enabled the
39 development of themes. QSR NVivo (Version 12) facilitated data management. Ethical approval was
40 obtained from the [anonymised] University Ethics Committee (ref: 25680/2022).

41

42 **Results**

43 Fourteen participants working in community pharmacies were interviewed, including: 8 qualified
44 pharmacists, 1 foundation trainee pharmacist, 3 pharmacy technicians/dispensers and 2 counter
45 assistants. Three themes were developed from the data which centred on: (1) defining and
46 appreciating cultural competency within pharmacy services; (2) identifying pharmacies as “cultural

47 hubs” for members of the diverse, local community; and (3) delivering cultural competence training
48 for the pharmacy profession.

49

50 **Conclusion**

51 The results of this study offer new insights and suggestions on the delivery of cultural competence
52 training to community pharmacy staff, students and trainees entering the profession. Collaborative
53 co-design approaches between patients and pharmacy staff could enable improved design,
54 implementation and delivery of culturally competent pharmacy services.

55

56 **Patient or public contribution**

57 The Patient and Public Involvement and Engagement group at [anonymised] University had input in
58 the study design and conceptualisation. Two patient champions inputted to ensure that the study
59 was conducted, and the findings were reported, with cultural sensitivity.

60

61 **Trial registration:**

62 Not applicable. Ethical approval was obtained from the [anonymised] University Research and Ethics
63 Committee (reference: 25680/2022).

64

65 **Key words:**

66 **Cultural competence; pharmacy; community pharmacy; health inequalities; ethnicity; qualitative.**

67

68 Introduction

69

70 Cultural competence can be defined as an individual's ability to possess the skills and knowledge to
71 effectively interact with people from different cultural backgrounds.¹ It involves the
72 acknowledgement, understanding and appreciation of an individual's cultural identity such as their
73 religion, ethnicity, nationality, gender and sexual orientation.^{2,3} Evidence has demonstrated that
74 being culturally competent promotes communication between individuals,⁴ respect for other
75 cultures, individual self-awareness¹ and support shared decision-making between individuals.⁵
76 Therefore, it can be considered a key attribute to those working within the healthcare system.⁶

77

78 The General Pharmaceutical Council Standards for Pharmacy Professionals report demonstrates the
79 responsibility of pharmacy professionals to *'treat people as equals, with dignity and respect, and*
80 *meet their own legal responsibilities under equality and human rights legislation, while respecting*
81 *diversity and cultural differences... (and) assess and respond to the person's particular health risks,*
82 *taking account of individuals' protected characteristics and background".⁷ Similar statements are*
83 acknowledged in the General Medical Council (GMC) Equality, Diversity and Inclusion Policy, which
84 ensures that the organisation and all medical professionals *"treat anyone who [we] interact with*
85 *fairly, without bias or discrimination",⁸ and in the principles of good practice for community*
86 pharmacy teams, to address health inequalities (point 1.2.6) in the National Institute of Health and
87 Care Excellence Guidance.⁹ Despite referring to cultural competence within the guidance from
88 professional bodies, there remains evidence of healthcare and medicines inequalities affecting
89 patients belonging to ethnic minority communities.^{5,10,11}

90

91 Recent studies have identified several factors which may contribute to these health inequalities,
92 including poorer health outcomes, lower reported health literacy levels, lower socio-economic
93 status, and feelings of disempowerment and distrust within the healthcare system for those from

94 underrepresented ethnic communities, compared to their White counterparts.^{12,13} Evidence suggests
95 that one approach of tackling the aforementioned health inequalities could relate to the education
96 and training of healthcare professionals, particularly developing skills to become culturally
97 competent.^{11,14-16} Govere *et al.* demonstrated that cultural competence training had a positive
98 impact on cultural awareness and overall competence of healthcare professional consultations,
99 hence improving rates of patient satisfaction.¹⁴

100

101 Most knowledge around training of cultural competency within healthcare settings currently focuses
102 on the fields of nursing, medicine and dentistry. There have been variations in proposed strategies
103 and frameworks for teaching cultural competence to these healthcare professionals;¹⁷ for example,
104 including the provision of online, self-directed learning sessions for trainees,¹⁸ as well as face-to-face
105 workshops and seminars, delivered by trainers.¹⁹⁻²² One setting within healthcare that encounters a
106 wide range of culturally diverse patients is community pharmacy. Community pharmacy is regarded
107 as a vital and easily accessible healthcare setting to any patient who requires health advice and
108 treatment.²³ A recent study proposed that cultural competence training should be implemented into
109 the training curriculum of all staff working within community pharmacies;¹⁰ however, limited
110 research exists on the optimal delivery methods of cultural competence training to meet this
111 need.^{24,25}

112

113 By exploring the perspectives of community pharmacy staff members, this qualitative study aims to:
114 (i) provide new insights that showcase beliefs and attitudes towards cultural competence within the
115 pharmacy profession and (ii) identify strategies to implement and deliver training for community
116 pharmacy staff to use within their culturally diverse places of work.

117

118

119 Method

120

121 Recruitment and sampling

122

123 The consolidated criteria for reporting qualitative research (COREQ) checklist was followed for this
124 work (see Multimedia Appendix).²⁶ Given the capabilities of digital strategies to support qualitative
125 research, a blended-strategy was applied to perform participant recruitment and data collection
126 with pragmatism. Recruitment was facilitated by community pharmacies, community charities and
127 professional networks based in the North East of England, as well as on the social media profiles of
128 two members of the research team (JMCC and AR-B). All interested participants who contacted the
129 research team were emailed an information sheet and consent form detailing the purpose and aim
130 of the research. Those who expressed an interest and gave their written consent, were enrolled to
131 the study. There was no relationship established between the researcher and participants prior to
132 study commencement or recruitment. Inclusion criteria comprised: participants over 18-years of age
133 who held a role within a community pharmacy team working in the UK (including, but not limited,
134 to: pharmacists, foundation trainee pharmacists, pharmacy technicians, dispensers/dispensing staff
135 and counter assistants). Purposive sampling was used to recruit participants and ensure
136 representation from a variation of typical job roles within community pharmacy teams; participants
137 were also of mixed age ranges, had been qualified in their job role for varying lengths of time and
138 were from varying ethnic backgrounds.

139

140

141 Semi-structured interviews

142

143 In-depth, semi-structured interviews were conducted by one researcher (JMCC, a female pharmacy
144 student researcher with experience of qualitative research) between October and December 2022.

145 Interviews were conducted either remotely, *via* Zoom® or telephone calls, or in-person (face-to-
146 face); all participants were offered the choice of which format they would prefer. The semi-
147 structured interview topic guide (see Supplementary File) was developed based on three pilot
148 interviews and covered key issues identified in the existing literature,^{5,10,11} including participants’
149 knowledge of cultural competence within pharmacy and wider healthcare settings; participants’
150 perspectives and experiences of interacting with patients from ethnic minority communities; and
151 their views and suggestions on cultural competence training. In addition, the topic guide was
152 informed by findings from a previous qualitative study conducted by the research team⁵ and the
153 lived experiences of patient champions involved as co-authors in this study (LS and AKD).

154

155 Data analysis

156

157 All semi-structured interviews were audio-recorded to enable data analysis. The audio files were
158 encrypted and transcribed verbatim by JMcC; immediately following transcription, the audio files
159 were deleted. All interview data were anonymised at the point of transcription and all transcripts
160 were checked for accuracy and correctness by AR-B. Participants did not provide comment on the
161 transcripts nor feedback on results.

162

163 Following reflexive thematic analysis processes, as defined by Braun and Clarke,^{27,28} the principle of
164 constant comparison guided an iterative process of data collection and analysis. Reflexive thematic
165 analysis was performed by two researchers (JMcC and AR-B) to analyse the interview data. Close and
166 detailed reading of the transcripts allowed the two researchers to familiarise themselves with the
167 data. Initial descriptive codes were identified in a systematic manner across the data sets; these
168 were then sorted into common coding patterns, which enabled the development of analytic themes
169 from the data. The themes were reviewed, refined and named once coherent and distinctive. Two
170 authors (JMcC and AR-B) performed the data analysis through discussion and, if agreement was not

171 reached, by consensus with the wider research team (LS, AKD, WML, AKH and AT). Post-interview
172 field notes enhanced this reflective process. NVivo (version 12) software was used to facilitate data
173 management. The research team were in agreement that data saturation (or data sufficiency and
174 information power) occurred after conducting 12 semi-structured interviews and thus, study
175 recruitment stopped following interview number 14.²⁹ To ensure confidentiality when using direct
176 patient quotes within this research, non-identifiable pseudonyms are used throughout, *e.g.*,
177 Participant 1 and Participant 2 *etc.*

178

179 Considerations when reporting participant demographics

180

181 The researchers wished to consider whether there were any connections or associations between
182 perspectives shared by participants, and their ethnicity. Collecting data on a person's ethnic group is
183 complex, since ethnicity in itself is a multi-faceted and changing phenomenon.³⁰ Various ways of
184 measuring ethnicity exist and could include a person's country of birth, nationality, religion, culture,
185 language, physical appearance or a combination of all of these aspects.^{3,31} Efforts have been taken in
186 this study to report a multitude of these aspects, to demonstrate the multi-faceted layers that
187 accompany discussions about ethnicity. The UK Office of National Statistics 'Ethnic group, national
188 identity and religion',³ the UK Census Reporting Classification,³² and the National Institutes of Health
189 (NIH) 'Racial and Ethnic Categories and Definitions for NIH Diversity Programs and Other Reporting
190 Purposes'³¹ guides were used to inform the reporting of participant ethnicity for this study (as
191 demonstrated in Table 1). Table 1 also includes a column for self-identified ethnicity and is reported
192 verbatim from each participant's interview.

193

194

195 Ethical approval

196

197 Ethical approval was obtained from the [anonymised] University Ethics Committee (reference:
198 25680/2022) and research governance was followed in accordance to [anonymised] University
199 research policies.

200

201

202 Results

203

204 Participant demographics

205

206 Fourteen participants in total were recruited and interviewed for this study (participant
207 characteristics are described in **Table 1**). Of the fourteen participants interviewed; eight described
208 their job role within community pharmacy as pharmacists (57%), one interviewee was a foundation
209 trainee pharmacist (8%), three were dispensers/pharmacy technicians (21%) and two were counter
210 assistants (14%). Ten participants self-reported their ethnicity to be White, with nine stating they
211 were British and one stating they were Scottish; one participant identified as mixed-race British; two
212 participants identified as Chinese, and one identified as Pakistani. The average age of the
213 participants was 30 years (SD ± 8.06). Participants worked within community pharmacy settings
214 across the UK; specifically, nine participants worked across the regions of Northumberland, Tyne and
215 Wear (England), three participants worked across Yorkshire (England), two participants stated they
216 worked in London (England), and one participant worked in Glasgow (Scotland). Nine interviews
217 were conducted over video call-based software (64%), four interviews were conducted over the
218 telephone (28%) and one interview was carried out in-person (8%). There were no refusals to
219 partake, participant drop outs or repeat interviews.

220

221 <Insert Table 1 here>

222 Three overarching themes were developed to reflect the perceptions of community pharmacy staff
223 on cultural competence and the delivery of cultural competence training within community
224 pharmacy. These focused on (1) defining and appreciating cultural competency within pharmacy
225 services; (2) identifying pharmacies as “cultural hubs” for members of the diverse, local community;
226 and (3) delivering cultural competence training for the pharmacy profession (Figure 1). The three
227 themes, and their sub-themes, are discussed in turn.

228

229 <Insert Figure 1 here>

230

231

232

233

234

235

236

237

238 Theme 1: Defining and appreciating cultural competency within pharmacy

239

240 *Definitions and understanding*

241 Cultural competence was believed by most participants to relate to the awareness and appreciation
242 of another person's culture, with one explaining that being culturally competent is *"about*
243 *understanding and appreciating people from a lot of diverse backgrounds – that are different to*
244 *yours. So that's whatever ethnicity you are, it's understanding about cultures and upbringing and all*
245 *the things that make you, you"* (Participant 8). In this sense, cultural competence was interpreted, in
246 a wider social context, as a skill that an individual can develop through interactions with people from
247 different cultures. Other participants described cultural competence as a concept relative to health,
248 and drew on their medicines expertise to address this; they described cultural competence as being
249 *"inclusive in your treatment of those patients and being able to build that into the way we approach*
250 *patient care and healthcare decisions"* (Participant 6).

251 *"You've got to be aware of issues such as religion, race or cultural differences that*
252 *may require a different approach to treating that patient... you know what they*
253 *can and can't eat for example, you can offer them alternative medication with*
254 *products that wouldn't be offensive or unacceptable to them"* (Participant 5).

255

256 *Cultural beliefs influencing decisions about medicines*

257 Participants provided examples where it was important to be aware of formulation considerations
258 and excipients within medications. Specifically, the suitability of capsules containing pork products
259 for someone practicing religions including Islam or Judaism was discussed, with one participant
260 stating *"somebody who's Muslim wouldn't be happy with pork products, like gelatine, in their*
261 *capsules"* (Participant 4). Others also recalled examples of investigating alternative medications to
262 suit a patient's cultural needs. A pharmacist explained, *"it took me probably a couple of hours to*

263 *source the medication in liquid form... I had to ring manufacturers and contact lots of different*
264 *companies to try and find an alternative and (pause) it took a lot of time” but they “knew it was*
265 *super important to them [the patient] and if was me in their shoes, I wouldn’t have taken that*
266 *medication because it’s not acceptable” (Participant 5). It was acknowledged by many participants*
267 *that although it may take additional time to source suitable medications for patients, it was*
268 *important for delivering high quality care, and there was an underpinning belief that these*
269 *additional considerations would lead to a more individualised approach to patient care.*

270

271 Other participants reflected that the beliefs of certain cultures may impact on an individual’s ability
272 to engage with healthcare access or medicines-taking. It was suggested that certain cultural beliefs
273 could pose as barriers to individuals accessing the care that they need, as there may be cultural
274 stigma surrounding certain health conditions. A pharmacist recalled an example where a Muslim
275 patient, who was receiving methadone treatment, said he would be *“mortified if a person from their*
276 *community had seen them” (Participant 4). The pharmacist contemplated that “some people*
277 *perceive that Muslims don’t drink and therefore it’s unusual for a Muslim to end up on methadone or*
278 *a dependent substance” (Participant 4). They hinted that patients should not be labelled under*
279 *common stereotypes and that health professionals should know to provide equal treatment to*
280 *patients, regardless of their cultural background.*

281 *“I think it’s about being concerned that they [patients] may be stigmatised within*
282 *their community... or if it’s perhaps not something that’s seen as appropriate in*
283 *their religion. It’s a little bit about shame, and personal shame and er, feeling like*
284 *they’re going against the cultural norm for them. I think that stigma could*
285 *potentially prevent them seeking help for their conditions” (Participant 4).*

286

287 Two participants reflected on experiences of barriers that prevented a person seeking healthcare or
288 medication advice, because they were *“a female (pharmacy professional) and their (the patient)
289 religion means they can’t, or shouldn’t, interact with females”* (Participant 5). Suggestions were
290 given around possible ways to overcome such barriers, even *“how pharmacy regulators could
291 engage with key members of those communities to try and explain how we can work together to
292 overcome that”* (Participant 5).

293 *“I think that one of the hardest challenges is where maybe the gender of the
294 person who delivering the care, is not seen as being appropriate to speak to a
295 male member of the public and say, ‘It’s ok to engage with a female member of
296 staff at the pharmacy. You’re not going to get in trouble if you do that”*
297 *(Participant 5).*

298

299 Theme 2: Identifying pharmacies as “cultural hubs” for members of the diverse local
300 community

301

302 *Recognising the diversity of populations accessing community pharmacies*

303 Participants discussed that community pharmacies are unique healthcare settings; they are an
304 accessible *“source of health advice and health care, where you can speak to a qualified professional,
305 all without requiring an appointment”* (Participant 3). One participant reflected that being a
306 community pharmacist meant *“you are often the first point of contact like in the community for any
307 patient”* (Participant 1) and one counter assistant recognised the diversity of patients that attend
308 community pharmacies, stating *“it’s not always the same ethnicity (within the patients we are
309 treating) and you’re rarely going to get a pharmacy that only has one ethnicity (in its population)”*
310 (Participant 12). Participant views across all job roles within community pharmacy described the
311 potential for interactions with members of a diverse population accessing the pharmacy. One

312 participant viewed the potential for community pharmacies to be regarded as “*cultural hubs*” that
313 local communities can access, knowing they will “*be recognised and spoken to in way that accounts*
314 *for them and their culture*” (Participant 11).

315

316 Most of the participants had experience working within various pharmacies across the UK and were
317 able to recall differences in the level of diversity between the pharmacies on a national-level, as well
318 as on a local-level. One participant discussed their experience of working as a locum pharmacist
319 across a number of cities across the North East of England, where diversity differences were even
320 noticed “*only 2-miles down the road you’ve got an entirely different community living there and*
321 *they’ll most likely need different approaches to people living 2-miles the other direction*” (Participant
322 6). Another pharmacist acknowledged diversity differences comparing inner-city pharmacies; they
323 described “*particularly in the North East, like in [name of major city], you can cross the bridge and*
324 *find communities that are highly populated with Jewish people, or you can cross another bridge and*
325 *find areas even more diverse again, like housing for refugees or asylum seekers from War torn*
326 *countries*” (Participant 6). There was also suggestion that pharmacies located in areas of higher
327 deprivation contained a greater population of ethnic minority patients. One pharmacist discussed
328 noticing diversity variations between two pharmacies they worked at with “*different sort of socio-*
329 *economic areas between [names of two villages]*” (Participant 7). As well, a participant who worked
330 in Scotland suggested “*where I work, [name of city], it’s like an affluent rural area... so I would say*
331 *predominantly the community is Caucasian, middle class people*” (Participant 4).

332

333 *Questioning the inclusivity of pharmacy services*

334 There was variation between participant perspectives on whether their pharmacy services
335 demonstrated inclusivity towards patients from ethnic minority groups. Most participants believed
336 their pharmacy services could better appreciate a person’s culture when providing care. One

337 pharmacy technician stated *“I think people are polite (pause), generally. But I don’t think there’s*
338 *anything in place to first recognise a patient’s cultural needs and then go from there”* (Participant 8).

339

340 Approaches that could improve the inclusivity of pharmacy services were discussed, with many
341 relating to language and the need for translators or interpreters to support conversations about
342 medicines. Translation and interpreter services were recognised as a potentially beneficial
343 pharmacy service for patients who do not speak English as *“a lot of information that we give across*
344 *to patients i.e., patient information leaflets, which are inside and the boxes and everything, well the*
345 *majority are just in English”* (Participant 7). Another participant, who worked in an area with a higher
346 level of deprivation, discussed strategies employed in their pharmacy which was managed by a
347 pharmacist from an ethnic minority background. They described how steps towards being more
348 culturally inclusive included *“translated medicine instructions on the wall ... sometimes posters are in*
349 *different languages... I don’t know it just feels different working in that pharmacy compared to your*
350 *average pharmacy, in that they’re more inclusive”* (Participant 9). It was also acknowledged by
351 several participants that community pharmacy records *“may not have someone’s ethnicity in the*
352 *notes that you can see”* (Participant 8) and the benefit of making this information readily accessible
353 was suggested, to inform decisions made by pharmacy professionals about the best course of
354 treatment for a patient.

355 *“I’d say we could probably do more, and that’s probably all community*
356 *pharmacies in general. And it’s even things like having leaflets in a different*
357 *language available – I mean we can print them off, but do we?... I’m aware of a*
358 *company that’s er that does prescription transcribing in hundreds of different*
359 *languages and it’s more accurate than Google Translate. But it’s only a very small*
360 *number of pharmacies that are using it. But I think the ones that are, it is just so*
361 *helpful to the patients”* (Participant 10)

362

363 *Gaining trust and forming culturally-respectful relationships*

364

365 Participants reflected on factors that might negatively impact on building culturally-respectful
366 relationships; for example, the effect of language barriers if a person has limited or low English
367 language proficiency, or use of colloquialisms when conversing with someone that does not speak
368 English as a first language. A counter assistant reflected *“where I work you sort of know a lot of the*
369 *people that come in – they’re like locals so you can have that like joke or bit of a chat with them. And*
370 *with someone of a different background, you don’t always have that. And er, it can be a bit tricky”*
371 (Participant 3). In fact, using cultural colloquialisms to build a better rapport with patients was
372 highlighted by a pharmacist. They stated that within Asian cultures *“they call like ‘Auntie’ and*
373 *‘Uncle’, they use that language and it’s friendly language instead of ‘Mr or Mrs’. Er, yeah, very*
374 *friendly terms used to create more of that rapport within the community”* (Participant 9).

375

376 Building trust and establishing culturally-respectful relationships was deemed by one participant to
377 be potentially more challenging to achieve between a pharmacist and a patient from a different
378 ethnicity or different culture. The employment of staff members from ethnic minority backgrounds
379 was recognised as a strategy to overcome this. Many participants reflected on examples they had
380 witnessed where staff members who spoke languages other than English were asked to speak to
381 certain patients. One pharmacist stated that their pharmacy had *“quite a few Romanian customers*
382 *who come in because they know that they can speak to someone in their language. Er, and I think*
383 *they tell their friends, ‘If you go to this pharmacy, they’ll speak Romanian”* (Participant 1). It was
384 speculated that this approach could help overcome communication barriers between pharmacy staff
385 and patients, by enabling inclusive conversations about medicines in a person’s native language.
386 Further, it was considered that diversity within pharmacy staff may lead to greater patient
387 satisfaction rates specifically focused on medicines; one participant stated *“so, I know it’s important*

388 *to build a rapport up with someone, but then to be able to have a proper focused conversation*
389 *understand it from a certain cultural perspective... that's like, that's achieving a proper goal for us"*
390 (Participant 9). A dispensing assistant echoed this thinking, describing *"when a patient who comes in*
391 *who's a Sikh, for example, our pharmacist is a Sikh so he can focus on their background and kind of*
392 *knows where they're coming from when they're asking about if it (their medication) is suitable"*
393 (Participant 2).

394

395

396 Theme 3: Educating and training cultural competence within the pharmacy profession

397

398 *Perspectives on current cultural competence training*

399 There was a consensus amongst participants involved in this study that their education and training
400 was lacking in topics encompassing cultural competence and its place within the pharmacy
401 profession. Some pharmacist participants stated that they remembered receiving some cultural
402 competence training once they had qualified, but this was included as part of a *"bigger topic such as*
403 *Equality & Diversity or Protected Characteristics"* within the workplace environment (Participant 7).
404 These perspectives around the paucity of cultural competence training were shared with other
405 community pharmacy staff, where one counter assistant stated that *"you just sort of have to deal*
406 *with it yourself, you don't really get any training on that"* (Participant 3). In fact, there was a
407 common opinion that due to the lack of cultural competence training within professional teaching, it
408 was necessary for individuals to educate themselves on cultural competence. One pharmacist
409 reported *"this thinking wasn't built into our teaching really. It wasn't er something we were taught;*
410 *it was just a good thing for you to look up in your spare time"* (Participant 1).

411

412 All interviewees regarded cultural competence as a necessary and important skill and all were in

413 agreement that some form of education should be built into pharmacy staff training. One pharmacy

414 technician stated *“I think whoever you are, if you are talking to members of the public who come into*
415 *the pharmacy or are someone who speaks to patients, you should have gone through a minimum*
416 *level of training on cultural competence”* (Participant 8). However, across the different job roles
417 within community pharmacy, there was a mixed consensus on who should receive cultural
418 competence training and to what level/depth. Almost all participants felt that cultural competence
419 training should be provided for counter assistants, with one participant stating *“a person walks in*
420 *and the first people they’ll speak to is the counter staff”* (Participant 5). It was acknowledged that if
421 counter assistants were not trained on cultural competence, *“it may affect the treatment of a*
422 *patient and could potentially impact how much a patient will use the pharmacy or whether they*
423 *come back or feel comfortable even coming in(to the pharmacy)”* (Participant 1). When discussing
424 their perspectives, a pharmacy dispenser expressed that pharmacists *“are the main people who are*
425 *giving advice out so if they’re not competent in what they’re saying (pause), then it’s not going to*
426 *help the situation”* (Participant 2).

427

428 Despite acknowledging the importance and place of cultural competence training, a number of
429 participants suggested that the profession of pharmacy, as a whole, has unmet needs around the
430 training and delivery of culturally competent patient care. One participant mentioned that, following
431 the Black Lives Matter movement, they have requested additional training on cultural competence
432 from their employer to improve their knowledge. Another reflected on the growing discussion of
433 equality and inclusivity in wider society, stating that *“the (COVID-19) pandemic was what brought*
434 *the whole issue about inequalities to light in my mind, and since then I’ve been thinking about what it*
435 *means for these patients from other communities”* (Participant 13).

436 *“... I don’t think, personally, as a profession, we’re prepared really. And we don’t*
437 *have that awareness – I certainly don’t feel like I’m optimally prepared for dealing*
438 *with situations where I have a lack of knowledge about someone’s ethnic*

439 *background. It's actually something that I've requested at work is some training*

440 *around it" (Participant 5)*

441

442 *Suggestions for the delivery of cultural competence training*

443 Participants gave suggestions on how cultural competence could be incorporated into formalised

444 training for each professional group. The training for counter assistants was described involving

445 *"booklets at the start... which you had to complete, and you had so long to complete them. And if*

446 *you pass them, you're classed as a counter assistant" (Participant 3). The same participant went on*

447 *to mention that "it [cultural competence training] should be in the booklet when you initially start,*

448 *and that should definitely be covered in the booklet" (Participant 3). Another counter assistant held a*

449 *different opinion and suggested that "if it was in a training handbook like where you watch videos*

450 *and answer quizzes, then people maybe wouldn't take it seriously. Er, like people might do the quiz*

451 *and not actually care or take it in as actually being important" (Participant 12). They reflected on the*

452 *potential for variation in the population of each pharmacy, dependent on geographic location, as*

453 *well as postulating a constant, dynamic change in "people living nearby, 'cos those trends of*

454 *communities choosing to live in a certain area might change" (Participant 12). When asked about*

455 *what should be taught within this training, it was proposed that a basic understanding and*

456 *awareness of different cultures should be taught "I think just explaining what it (cultural*

457 *competence) is and maybe an idea on how different backgrounds, you know, different people – their*

458 *views on sort of... pharmacy and medicines and things like that" (Participant 3).*

459

460 There was a suggestion made that it may be beneficial to teach cultural competence training

461 separately within the different professions and tailoring the training towards each professions'

462 specific roles within the pharmacy. A dispenser proposed that *"if everyone's taught separately but*

463 *on the same kind of guidelines, so it (cultural competence training) kind of factors in their different*

464 *job roles... then it's helpful if it's got some examples of what we can do, personally, relevant to us"*

465 (Participant 2).

466

467 Every pharmacist interviewed agreed that cultural competence training should be taught within the

468 undergraduate Masters of Pharmacy (MPharm) degree; however, there were differing perspectives

469 on the value it holds within the degree's curriculum. One pharmacist remarked *"I think it should be*

470 *taught, I think it's core, it's just as important as learning about pregnancy and drugs in pregnancy... it*

471 *needs to be included in the curriculum"* (Participant 5). As well, participants discussed the need for

472 cultural competence to underpin the entirety of their learning, rather than only featuring in one part

473 of the degree. There was a particular emphasis on introducing *"this way of thinking"* from the first

474 year of the degree, with one foundation trainee pharmacist discussing the value in having *"these*

475 *types of discussions or training from like an earlier stage, and from a younger age at university... that*

476 *would be good as opposed to leaving it until you're in the workplace like I am now"* (Participant 14).

477 Whilst other pharmacists recognised its importance, they considered the logistics of integrating

478 cultural competence training within the greater context of the MPharm degree curriculum and

479 acknowledged that there may limited room to include this training. One pharmacist stated that

480 cultural competence training should be *"definitely part of it [the MPharm]. I don't know if I'd say a*

481 *big part. Er (pause) not because it's not important – just thinking more in terms of how you'd fit it all*

482 *in"* (Participant 6).

483

484 Pharmacists offered suggestions on how cultural competence training could be delivered within the

485 MPharm degree. The most frequently mentioned methods considered adopting an integrated

486 approach to teaching, for example through the inclusion of ethnic minority patients within

487 workshops, patient-case examples and observed structured clinical examination (OSCE) stations, as

488 well as exposing students to working with people from ethnic minority communities on placements.

489 *"In case studies when you're doing seminars, you should ensure there's varied*
490 *names and ethnicities used in patient examples. Perhaps trying to encompass it*
491 *more into placements as well, where you are actually in real-life examples, so*
492 *you've got real-life patients and are seeing varied cross-sections of the population*
493 *in placements. You could potentially look at patient sessions where you bring*
494 *patients in and getting different backgrounds to talk about their experiences"*

495 *(Participant 7).*

496

497 Two participants contemplated that, rather than training students on cultural competence, the aim
498 of the MPharm teaching should be to instil an open-minded and inquisitive attitude in students for
499 whenever they engage with people from ethnic minority groups. These participants argued that
500 giving cultural training would not be appropriate, with one stating *"to sit down and have a lesson*
501 *and say, 'This is how you speak to someone who's Muslim' or 'This is how you speak to someone who*
502 *is from this ethnicity' – I think that's patronising"* (Participant 1).

503 *"I think it's really important that students don't become stereotypical and judge*
504 *people and assume based on the way that someone looks, that they have a*
505 *certain belief. I think it's more about students being open-minded (pause) and*
506 *having the ability to ask these questions... I just feel that's a skill we need to get*
507 *rather than understanding all the nuances of different cultures cos you can't*
508 *teach that – it's not possible. It's more about giving them the skills and then once*
509 *they work in practice, they deal with the communities that they encounter"*

510 *(Participant 4)*

511

512

513 Discussion

514

515 This study builds on the limited evidence that focuses on the perspectives of community pharmacy
516 staff surrounding cultural competence training. By exploring the perspectives of members of staff
517 across the entire skill mix of community pharmacy, this study (i) sheds new light on staff
518 perspectives on cultural competence training and (ii) offers unique suggestions on how cultural
519 competence training should be taught and delivered to all members of the community pharmacy
520 team. This study collected the perspectives from representatives of all community pharmacy staff
521 members: pharmacists, technicians, dispensers and counter assistant staff; an approach that is
522 unique to this study with these views previously being under-reported within healthcare research.

523

524 A consistent finding across all interviews reported an increase in the ethnic diversity of people
525 accessing community pharmacies, hence recognising the greater need for community pharmacy
526 staff to adopt an inclusive approach towards meeting the needs of their ethnic minority patient
527 groups. This echoes the findings from previous work^{11,23} and has been highlighted even more
528 following the COVID-19 pandemic.³³⁻³⁵ Ethnicity-related health inequalities is a well-researched area,
529 with numerous studies reporting a lack of patient engagement with services and variable treatment
530 outcomes in patients from ethnic minority groups, compared to their White counterparts.
531 Multifactorial reasons for this have been recognised, including perceived distrust in the healthcare
532 system, lower health literacy, limited access to timely care and language barriers;^{12,36-38} initial
533 strategies to overcome such challenges, specifically within community pharmacy, have been
534 identified in this study.

535

536 Echoing previous studies,^{39,40} communication difficulties and language barriers between patients and
537 healthcare professionals were perceived as a key challenge in achieving inclusive patient care within
538 community pharmacy settings. Interestingly, encounters with non-English speaking patients were

539 also a major concern amongst other healthcare professional groups.⁴¹ Previous work revealed that
540 computer-based translational resources were perceived as easily accessible and helpful within
541 American community pharmacy, but were infrequently used.⁴²⁻⁴⁴ “The Written Medicine,” is a new
542 UK web-based software which has been developed to tackle this issue through bilingual prescription
543 labels, including English alongside the person’s native language.⁴⁵ Future research should explore the
544 uptake and utilisation of such software within community pharmacies.

545

546 The use of interpreters was also a recognised approach to overcoming communication difficulties
547 between patients with Low-English Proficiency and members of the pharmacy team. Interpreters
548 were also important for providing high quality care to these patients. Although the use of
549 professional interpreters has been acknowledged as beneficial to facilitate healthcare consultations
550 within outpatient clinical settings,⁴⁶⁻⁴⁹ there has been a longstanding historical challenge to accessing
551 interpreters within community pharmacy.⁵⁰⁻⁵² Research on facilitating access to interpreters and
552 exploring pharmacy team experiences with interpreters could result in the sharing of best practice,
553 to improve culturally competent and medicines-focused communication.

554

555 Whilst participants recognised the significance of cultural competence training, they reported very
556 little to no experience of having cultural competence training within their professional education.
557 Results from this study echo the wider literature,^{53,54} which recognises the importance of integrating
558 cultural competency into the training of pharmacy staff. In 2021, the Centre for Pharmacy
559 Postgraduate Education launched a learning campaign on ‘Culturally competent person-centred
560 care’, designed for pharmacy professionals.⁵⁵ At present, research has yet to be done to evaluate the
561 impact or uptake of this amongst postgraduate, qualified pharmacists. Further, limited work exists to
562 explore the perspectives of student and trainee pharmacists on cultural competence within their
563 initial education and training; future studies should seek to address this to close the gap between
564 training at undergraduate and postgraduate level.

565

566 A key relationship was identified between participant ethnicity and their views on the importance of
567 cultural competency, with its training being deemed important by all White participants who were
568 interviewed. However, two participants who self-reported as being from an ethnic minority group
569 themselves (from Chinese and Pakistani backgrounds), hinted that cultural competence training
570 does not necessarily need to be a key part of professional training. Several White participants
571 stressed the importance of this training as, within their practice, they often worry about
572 unintentionally using the incorrect language/terminology.^{56,57} This study offers a new finding that
573 White healthcare professionals may regard cultural competence training as more important than
574 those from ethnic minority backgrounds; further research is needed to explore whether this is the
575 case and identify reasons why this may exist.

576

577 The researcher acknowledges that there were some limitations in this study. Whilst efforts were
578 taken to ensure an equal split in job roles amongst the participants, the majority were pharmacists
579 (n=8). Future studies should seek to further explore the perspectives of the wider roles within
580 community pharmacy teams. The most common ethnicity among the participants was White, British;
581 in order to make this study more representative, the perspectives of staff members from
582 underrepresented ethnic communities need further investigation. In doing so, this may help to
583 determine if culture plays a part in how cultural competence, and training, is perceived.

584 Perspectives of community pharmacy staff have been reported within this study. Future studies
585 could investigate the perspectives of underrepresented ethnic patient groups on how they believe
586 cultural competence training should be delivered to community pharmacy staff, to allow a
587 cooperative approach to re-evaluating the training strategies.⁵⁸ Previous studies have reviewed co-
588 production and co-design approaches to tailor health services to the needs of its users.^{59,60}
589 Therefore, including the perspectives of people from underrepresented ethnic groups would allow
590 their lived experiences and suggestions to be considered when formulating and reviewing cultural

591 competence training to community pharmacy staff. Furthermore, research could be widened even
592 more, by exploring perspectives on how cultural competence teaching can be promoted to address
593 the needs of other minoritised patient groups.

594

595 **Researcher positionality and reflexivity statement**

596

597 When conducting research on cultural competence and its wider connection to ethnicity, it is
598 important to acknowledge the positionality and reflexivity of the research team. Authors JMcC, AH,
599 AT and AR-B recognized their privilege as nonethnic minority UK citizens. Author WML, and patient
600 champions LS and AKD self-report as being from an ethnic minority community; they ensured
601 cultural appropriateness and sensitivity throughout the entire research process.

602

603

604 **Conclusion**

605

606 Cultural competence is important for community pharmacy staff to develop, due to the increasing
607 patient diversity they encounter. As pharmacists and counter assistants are primarily patient-facing
608 roles, cultural competence training should be an essential part of their professional training.
609 Interactive, informal teaching to encourage an open-minded attitude towards cultural differences,
610 was preferred over structured, information-based sessions. Future research may seek to further
611 explore the integration of cultural competence training with undergraduate pharmacist initial
612 education and training, as well as postgraduate learning programmes. Research opportunities into
613 co-production and co-design strategies between trainees and training organisations could improve
614 the design of cultural competence training. Additionally, the perspectives of patients from ethnic

615 minority communities could provide valuable insight and offer recommendations on the cultural
616 competence training delivered to pharmacy professionals, and wider.

617 **Declarations**

618

619 **Funding**

620 This work was undertaken as part of a Masters of Pharmacy Undergraduate degree (author JMcC,
621 supervised by author AR-B); there was no funding for this work.

622

623 **Acknowledgements**

624 The authors would like to thank all of the participants involved in this research; without whom, this
625 work would not be possible. The authors would also like to thank the wider steering group patient
626 champions who made this work possible: Manpreet Olk, Evneesh Dhinsa, Samia Fiazei and Jel Nagra.

627

628 TABLES

629 *Table 1: Participant demographics*

630

Participant number	Reported sex	Age range (years)	Staff role within Community Pharmacy	Self-reported ethnicity	Interview format	Interview duration (minutes, seconds)	Region of practice within UK
1	Female	20-29	Pharmacist	White, British	Video-call (Zoom)	42m 38s	Northumberland / Tyne & Wear
2	Female	20-29	Dispenser	White, British	In-person	20m 19s	York
3	Female	40-49	Counter Assistant	Mixed-race, British	Telephone	22m 07s	Northumberland
4	Female	30-39	Pharmacist	White, Scottish	Telephone	39m 52s	Glasgow
5	Female	40-49	Pharmacist	White, British	Video-call (Zoom)	52m 22s	Northumberland / Tyne & Wear
6	Male	20-29	Pharmacist	White, British	Video-call (Zoom)	55m 19s	Northumberland / Tyne & Wear
7	Female	30-39	Pharmacist	White, British	Video-call (Zoom)	41m 39s	Northumberland
8	Female	40-49	Pharmacy Technician	White, British	Video-call (Teams)	26m 46s	London
9	Female	30-39	Pharmacist	Chinese	Video-call (Teams)	32m 22s	Northumberland / Tyne & Wear
10	Male	40-49	Pharmacist	Pakistani	Video-call (Zoom)	23m 21s	South Yorkshire
11	Male	30-39	Pharmacist	Chinese	Video-call (Zoom)	39m 52s	York and London
12	Female	20-29	Counter Assistant	White, British	Telephone	22m 41s	Northumberland
13	Male	20-29	Dispenser	White, British	Telephone	25m 21s	Tyne & Wear
14	Female	20-29	Foundation Trainee Pharmacist	White, British	Video-call (Zoom)	30m 04s	Tyne & Wear

631 **FIGURE LEGENDS**

632 Figure 1: Factors influencing the creation of a culturally competent pharmacy profession: developed
633 from the perspectives of pharmacy professionals

634

635 **Acknowledgements:** The authors wish to acknowledge and thank the participants that were interviewed as
636 part of this research; without whom, this work would not have been possible.

637

638 **Data availability statement:** The data that support the findings of this study are available from the
639 corresponding author upon reasonable request.

640

641 **Funding statement:** This work was undertaken as part of a Masters of Pharmacy Undergraduate degree
642 (author JMcC, supervised by author AR-B); there was no funding for this work.

643

644 **Author contributions:** JMcC led on the day-to-day running of the project, data collection and writing of this
645 manuscript. AR-B and WML oversaw the running of this project as Principal Investigators and provided project
646 management expertise. AR-B, AH and AT provided qualitative methodological input and expertise. AR-B and
647 AH supported the recruitment of participants. LS, SV and AKD contributed in their appointment as ethnicity
648 champions and ensured cultural appropriateness and sensitivity throughout the entire research process. All
649 authors read, provided comments on, and approved the final manuscript.

650

651 **Conflict of interest disclosure:** None.

652 **Ethics approval statement:** Ethical approval was obtained from the [anonymised] University Research and
653 Ethics Committee (reference: 25680/2022).

654 **Patient consent statement:** There were no patients involved in this study; it was conducted to gather the
655 perspectives of healthcare professionals (and signed consent was gained at study enrolment).

656 **Permission to reproduce material from other sources:** Not applicable; this work is original.

657 **Clinical trial registration:** Not applicable.
