24 **ABSTRACT :**

25 With the low adhesion to voluntary mutual health insurance, Senegal's policymakers have sought
26 to understand the feasibility of compulsory health insurance membership. This study aims to
27 measure the acceptability of mandatory membership in community-based mutual health insurance
28 (CBHI) and to understand its possible administrative modalities.

29 The study consists of a national survey among a representative population sample selected by
30 marginal quotas. The survey was conducted in 2022 over the phone, with the random composition
31 method among 914 people. The questionnaire measured the socio-economic characteristics of
32 households, their level of acceptability concerning voluntary and compulsory membership, and their
33 level of confidence in CBHIs and the health system.

34 Respondents preferred voluntary (86 %) over mandatory (70 %) membership of a CBHI. The gap
35 between voluntary and compulsory membership scores was smaller among women ($p=0.040$),
36 people under 35 ($p=0.033$) and people with no health coverage ($p=0.011$). Voluntary or compulsory
37 membership was correlated ($p=0.000$) to trust in current CBHIs and health systems. No particular
38 preference emerged as for the preferred administrative channel (e.g. death certificate, identity card,
39 etc.) which could enable to enforce the mandatory character.

40 The results confirmed the well-known challenges of building universal health coverage on the basis
41 of CBHIs, a model which is poorly appreciated and whose low performance reduces the acceptability
42 of populations to adhere to it, be it on a voluntary or mandatory basis. Suppose Senegal persists in
43 its health insurance approach. In that case, it will be essential to strengthen the performance and
44 funding of CBHIs, and to gain population trust to enable a mandatory or more systemic membership.

45

46

47 **INTRODUCTION:**

48 In their search for solutions to cover their citizens with health insurance, African countries face many
49 challenges and have tested various strategies (1). In Francophone West Africa, community-based
50 health insurance (CBHI) has long been the preferred instrument for covering populations in the
51 informal and rural sectors (2–4). However, while evidence shows CBHIs protect their members (3,5),
52 their penetration rates are very low. In Senegal, less than 5 % of the population is affiliated with a
53 CBHI (6,7) despite membership being subsidized and the fact that they have been at the heart of
54 the health financing policy for over a decade (8–10). As international organisations and many
55 experts explain, the voluntary nature of membership and their amateurist management question
56 the usefulness of CBHIs as a tool for progressing towards universal health coverage (UHC) (11–13).
57 Since 1952, the International Labour Organization (ILO) Convention 102 on Social Security has
58 affirmed the importance of compulsory or automatic membership. However, the Regulation on
59 Social Mutuality of the West African Economic and Monetary Union (WAEMU) recognizes the right
60 to freely adhere and choose a mutual organization.

61

62 Since 2014, Senegal has experimented a different model of CBHI, consisting in departmental mutual
63 health insurance managed by professionals, whose coverage rate demonstrate its relevance (14).
64 Despite being based on voluntary membership, they pave the way for expanding the system through
65 the adoption of a mandatory membership. However, no research has yet been undertaken in
66 Senegal to understand the social acceptability of such compulsory membership. The 2017 national
67 health financing strategy and the 2019 National Health Development Programme (PNDSS 2019-
68 2028) proposed to study the feasibility of such a mandatory approach (15,16). In particular, the
69 PNDSS calls *for the promotion of 'mechanisms linking compulsory membership in an insurance*

70 *scheme of one's choice and obtaining certain administrative documents and advantages (driving*
71 *licence, etc.)*.(16). In 2020, the President of the Republic was suggested to organise a '*smart*
72 *obligation*' through requesting the proof of one's affiliation to an insurance scheme to benefit from
73 micro-credit or to carry out administrative acts (17). In Rwanda, for example, health insurance
74 membership is compulsory, and many people are affiliated to a CBHI, although they are now more
75 State than Community instruments (18). Senegal was the first African country to ratify ILO
76 Convention 102 in October 1962, but not in relation to health insurance (19). A national evaluation
77 undertaken in 2021 (20) presses Senegal to significantly reform its UHC strategies , in particular
78 through a reevaluation of the systematic nature of membership of departemental mutualhealth
79 insurance organisations.

80

81 This article aims to measure the propensity of the Senegalese population to accept a potential
82 obligation to adhere to mutual health insurance and to understand the feasibility of administrative
83 arrangements.

84

85 **MATERIALS AND METHODS**

86 Setting :

87 The study was conducted in the 14 administrative regions of Senegal. The average age in Senegal is
88 19 years; men account for 49.7 % of the population.

89

90 Population under study:

91 This is a descriptive and analytical cross-sectional study. The data were collected from April 26 to
92 July 22, 2022. The study population comprised people aged 18 and over in the general population
93 with a mobile phone number and not already a member of a CBHI.

94

95 Sampling:

96 The study used a marginal quota sampling strategy (21). To ensure a representative population
97 sample, we performed a precision stratification by region, sex and age group. Following an approach
98 already used by our team for surveys during the pandemic (22,23), we randomly generated a list of
99 nine-digit phone numbers from the mobile phone numbers assignable in Senegal using the Random
100 Dialing (RDD) method. We integrated this list into a Reactive Auto Dialer (RAD) to trigger calls
101 automatically and optimally. A total of 914 people participated in the study.

102

103 Data collection:

104 Five research assistants speaking the six main languages of Senegal (French, Diola, Wolof, Serère,
105 Pulaar, Soninké) collected the quantitative data using a close-ended structured questionnaire by
106 telephone. They administered the questionnaire using tablets with the Open Data Kit (ODK)
107 software. The final version of the questionnaire was tested during the assistants' training and then
108 validated by the team members after several corrections. In addition to socio-economic variables
109 (age, gender, education, marital status, assets), we conceptualised the collected variables according
110 to the seven dimensions of the Sekhon et al. acceptability model (24), whose previous relevance
111 was verified in the context of Senegal (22). Each of the seven dimensions was appraised by along a
112 Likert scale ranging from one (do not agree at all) to five (strongly agree). These dimensions (Table
113 1) have made it possible to assess the interest of the population in joining a CBHI on a voluntary

114 basis, but also to grab perceptions on a possible mandatory adhesion(Box 1) conditioning the access
115 to a number of administrative acts (compulsory membership). The proposed channel list
116 corresponds to Senegal's most frequent administrative acts. The role of trust in the acceptability of
117 measures has been revealed in our previous studies in Senegal (22) as well as the literature on CBHI
118 membership (3) and health systems (25). Thus we added two questions about trust in i) existing
119 CBHIs, and ii) the health system and its ability to protect patients against catastrophic expenditure
120 in the UHC context.

121 *Table 1 : Operationalisation of the 7 dimensions of acceptability*

Dimension	Voluntary membership	Compulsory membership
Importance	I have understood the importance of joining a mutual health insurance offered to all on a voluntary basis.	I have understood the importance of making membership of a mutual health insurance compulsory in order to carry out administrative acts.
Effort	I will make a great deal of effort to be able to join a mutual health insurance offered to all on a voluntary basis.	I will make a great deal of effort to be able to comply with the obligation to join a mutual health insurance to carry out administrative acts.
Perceptions	My feelings about the voluntary membership of a mutual health insurance offered to all are positive.	My feelings about this obligation to join a mutual health insurance to carry out administrative acts are positive.
Effectiveness	I believe that voluntary membership of a mutual health insurance proposed to all will improve the health coverage of Senegalese people.	I believe that making membership of a mutual health insurance compulsory to carry out administrative acts will improve the health coverage of Senegalese people.
Benefits	I think the benefits that will be derived from voluntary membership of a mutual health insurance offered to all are worth the investment I will have to put forth in order to get it.	I think that the benefits that will be derived from making membership of a mutual health insurance compulsory to carry out administrative acts are worth the investment I will have to put forth in order to respect it.
Trust	I am confident in my ability to join a mutual health insurance offered to all on a voluntary basis.	I am confident in my ability to respect the obligation to join a mutual health insurance to carry out administrative acts.
Personal values	Joining a mutual health insurance offered to all on a voluntary basis is in line with my personal values.	Making membership of a mutual health insurance compulsory to carry out administrative acts is in line with my personal values.

122

123

Box 1: Definition of a CBHI used in the questionnaire

A mutual health insurance is an organisation that receives voluntary (thus non-compulsory) contributions from its members in advance. People pay a membership fee, once in their lifetime at the beginning, then they pay a membership fee each year. It covers a large part (often 80 %) of the costs of healthcare for sick members and their dependents. It does not reimburse contributions if the member or her/his dependents have not been sick.

124

125 Data Analysis:

126 We carried out a descriptive study of the different variables. Qualitative variables were described
127 through frequency measurements with their confidence intervals, with a 95 % confidence level, and
128 quantitative data through central trend and dispersion measurements. A cross-sectional analysis
129 was performed between the dependent and relevant independent variables. Appropriate statistical
130 tests (Student, Mann-Whitney) were used to measure associations with an alpha risk of 5 %.
131 Correlations were computed to study the links between the different dimensions. The acceptability
132 of membership in CBHIs was appreciated by constructing two scores: one for voluntary membership
133 and one for mandatory membership. These scores were obtained by combining individuals' degrees
134 of approval for membership of a CBHI offered to all voluntarily, with the benefits derived from such
135 membership and the compatibility between such membership and personal values. The scores thus
136 obtained, whose consistency was verified using the Cronbach Alpha Index (0.989 for compulsory
137 membership and 0.939 for voluntary membership), were standardised to vary between 0 and 100.
138 All analyses were carried out with the software STATA 14.

139 Ethics approval and consent to participate

140 All individuals were informed of the ethical issues and were allowed to withdraw from the study at
141 any time. They all agreed to participate through verbal informed consent recorded by the
142 interviewer under the supervision of the researchers. No minor participated in this research. The
143 research was accepted by Senegal's National Health Research Ethics Committee
144 (42/MSAS/CNERS/SP/2021).

145

146 **RESULTS**

147 Most of the sample comprised women (51.3 %) and young people under 35 (54.8 %). A large
148 proportion (44.7 %) were uneducated (Table 2).

149

Table 2: Characteristics of respondents (n=914)

Variable	Number	Percentage
Gender		
Female	469	51.3 %
Male	445	48.7 %
Age category		
Under 35 years	501	54.8 %
35 years and over	413	45.2 %
Level of education		
Without education	409	44.7 %
Primary	163	17.8 %
Secondary	239	26.1 %
Tertiary	103	11.3 %
Marital status		

Married monogamous	451	49.3 %
Married polygamous	142	15.5 %
Divorced	22	2.4 %
Widow(er)	38	4.2 %
Single	258	28.2 %
Refused to say	3	0.3 %
Quintile of well-being		
Poorest	182	20.0 %
Poor	183	20.0 %
Average	183	20.0 %
Rich	183	20.0 %
Richest	183	20.0 %
Total	914	100.0 %

150

151 Respondents were more in favour of voluntary membership (86 %) of a CBHI than of compulsory
 152 membership (70 %). The rejection of mandatory membership was significantly more predominant
 153 among men (59 %), those with higher education (68 %), those covered with a non-mutual health
 154 insurance (75 %), those distrusting the current functioning of CBHI (76 %), and those with low
 155 confidence in the government's health system (57 %).

156 The gap between voluntary and compulsory membership scores was significantly smaller among
 157 women ($p=0.040$), young people under 35 years ($p=0.033$) and people with no health insurance
 158 ($p=0.011$). The difference did not appear to be influenced by marital status ($p=0.096$), education
 159 ($p=0.252$), and income ($p=0.034$).

160 Be it regarding voluntary or compulsory membership, a sense of trust played an important role. The
 161 correlation between trust and membership was unambiguous ($p=0.000$). The more people were

162 confident in the current functioning of CBHI (Figure 1) or in the way in which the State takes care of
163 its health system (so that it is accessible to all, of quality and without financial consequences for
164 service users) (Figure 2), the more they were in favour of (voluntary or compulsory) membership.

165

Figure 1: Level of membership score according to confidence (yes/no) in the government as for
the management of CBHI

Figure 2: Level of membership score according to confidence (low, medium, high) in the current
health system

166

167 The study did not reveal any particular preference as for the administrative channel that would
168 make it possible to enforce the mandatory character of adhesion. The level of acceptability (63 % to
169 65 %) was overall the same if payment would be requested when drawing up a death certificate,
170 identity card, passport, birth certificate or registration of children in school. Moreover, among those
171 supporting compulsory membership, the higher their education degree and the less they accept this
172 principle, regardless of the proposed administrative channel (Table 3). There was no statistically
173 significant difference in relation to the economic level of the respondents.

174

175

176 Table 3: Preferred administrative channel for enforcing systematic membership, for those in favour
 177 of the strategy

	Not educated	Primary	Secondary	Tertiary	P value
Requesting a death certificate	93.50%	93.50%	83.30%	82.90%	0.008
Applying for a national identity card	94.60%	95.90%	82.90%	67.90%	0.000
Opening a micro-business	92.40%	97.50%	86.70%	75.90%	0.000
Applying for or renewing a passport	92.30%	94.70%	84.60%	75.10%	0.013
Applying for or renewing a driving licence	92.40%	95.80%	87.20%	67.00%	0.000
Paying income tax	92.40%	94.90%	87.00%	78.80%	0.018
Enrolling children in school	94.60%	96.90%	90.20%	87.80%	0.199
Requesting a birth certificate	95.60%	96.50%	84.30%	69.60%	0.000

178

179 **DISCUSSION:**

180 This study shows that many people declared *intending to* accept the voluntary nature of
 181 membership in CBHI. This high acceptance of the voluntary nature of the contribution has already
 182 been revealed in a research on UHC in Burkina Faso (26). Beyond the methodological challenges of
 183 this survey, the low *current* rate of the total membership in Senegal (1,10) confirms the low
 184 attractivity of CBHIs to date. Beyond the technical and financial challenges, social representation
 185 vis-à-vis CBHIs in Africa, particularly in Senegal (27), influences their attractiveness, which does not
 186 seem sufficiently studied by researchers yet, nor considered by operators (28). Overall, Senegal's
 187 CBHIs do not yet meet populations' needs, they are still hardly known to them, and their functioning
 188 is not optimal (8,10,27,29,30). Since the acceptability is even lower as for the mandatory character
 189 of membership, and closely linked to trust in current (health and CBHI) systems, strengthening CBHIs
 190 is undoubtedly a prerequisite before any reform.

191 The COVID-19 pandemic and State response measures, notably in Senegal, have emphasised the
192 importance of citizens' trust in the acceptability of public policies. As with this study, the more
193 educated people are, the more they question the merits of these measures organised by a State
194 whose ability to solve their problems better than they do is doubtful (22). The issues of solidarity
195 and risk-sharing among population groups are at the heart of UHC debates, as surveys elsewhere in
196 Africa show (26,31). It will be recalled that in Mali, when the government imposed compulsory
197 insurance for academic professors, they opposed it, and the government had to step back (32). In
198 addition, considerable research on health systems also confirms the importance of trust between
199 health professionals (25,33) and also users for the effectiveness of health services as well as
200 members of CBHIs (34), particularly in Senegal (27). Research in Burkina Faso has shown how central
201 this trust is to adherence to UHC financial principles (26). This study confirms these results for
202 Senegal.

203 Expanding population health insurance coverage would improve efficiency and equity in a
204 fragmented and underfunded Senegalese health system (35), where governance is questioned
205 (9,36). This also requires improving the overall functioning of the health financing system and
206 addressing the critical challenges in terms of fiscal space (where can resources for CBHI membership
207 be found?), the strategic purchasing of health services and the operational efficiency of financial
208 management (37). In addition, evidence increasingly demonstrates the better performance of
209 government tax-funded systems over those funded through contributory social insurance (38),
210 which Senegal should consider. But the failure of CBHIs in Tanzania drove researchers to assert that
211 *'making health insurance mandatory requires an adequate legal and regulatory framework to help*
212 *safeguard the mandatory membership and protect a standard Minimum Benefits Package (MBP)*
213 *and entitlement of members'* (39).

214 Following a recent evaluation (20), the Senegalese National Agency for Universal Health Coverage
215 launched a significant reform in early 2023. First, it confirmed its announcements at the end of 2022,
216 and explained that all communal CBHIs would be dissolved and that only departmental CBHIs will
217 be organised nationwide. In addition to strengthening their professionalisation, this levelling up in
218 risk pooling has the potential to improve the financial sustainability of health insurance, as has long
219 been proposed for the region (1,40). Furthermore, the National Agency announced the end of State
220 subsidies amounting to 50 % of the annual adhesion fees for contributors and to 100 % for non-
221 contributors. It announced its intent to transform membership subsidy into purchasing CBHI
222 members' healthcare consumption directly to health facilities. These two major changes have
223 caused significant tensions with the National Union of CBHI. They may be the consequences of the
224 fiscal space challenges or a change in government priorities. The future will tell us whether these
225 reforms increase citizens' confidence in their health and CBHI systems and contribute to rendering
226 membership more systematic. Even if the policy instrument is unchanged (insurance), it may
227 illustrate a return of the State (41) in the field of social protection, as has long been demanded (42).
228 As with the success of CBHIs in Ethiopia, it is essential to give a '*signal of strong political and*
229 *government commitment*' (43). It may be time to invalidate the conclusion that '*health and health*
230 *goals might be unimportant to a country's policy choices*' (44).

231

232 The study makes it possible to propose some involvement pathways for Senegal's public health
233 system that UHC stakeholders discussed during a workshop organised by the National Agency in
234 December 2022. First, it appears urgent to strengthen the performance of CBHIs and the insurance
235 system in general before considering making it mandatory. The current reforms (professionalisation,
236 departmentalisation, digitalisation) should allow this improvement since the new governance

237 structure gives room to community approaches and citizens, strengthening the collective identity
238 that seems to have been lacking so far in Senegal (45). Even if CBHIs disappear and are transformed
239 into a health insurance fund, the question of subscription and financing will remain a central
240 element: *'there is now general agreement in the literature that, for countries to make progress*
241 *towards UHC, health financing needs to include aspects of both compulsion and redistribution'* (46).
242 Secondly, there is an urgent need to improve the public's confidence in CBHIs (including services
243 rendered and reimbursements) and in the health and social protection systems. Finally, Senegal was
244 able to impose the declaration of the blood type for the realisation of the new digital driving licence
245 in 2019. Suppose all administrative channels seem possible to enforce the compulsory contribution
246 for health insurance. In that case, it becomes urgent to check its technical feasibility and to manage
247 specific communication processes adapted to the targets.

248

249 This research has several limitations. First, given the tiny percentage of people with health insurance
250 in Senegal (exposure), the questions asked about contributions may have been misunderstood (26)
251 even if we have clearly explained the definition of CBHIs (Box 1). In addition, the study focuses on
252 the acceptance of membership in CBHIs rather than on a more general insurance system or on
253 increasing resources through taxes. Finally, the study was conducted over the telephone and with a
254 quantitative questionnaire, leaving little room for discussion. This recalls the need for subsequent
255 qualitative studies to better understand, for example, the possible bias of social desirability, as
256 mentioned in Burkina Faso (26). This survey method over the telephone also reduced our ability to
257 have more accurate household socio-economic data for further statistical analysis; the calculation
258 of the standard of living based on the assets requested over the phone may explain the need for
259 more relation to the variables of interest.

260 **CONCLUSION**

261 As Senegal embarks on a critical UHC reform process as for its risk pooling system, this research
262 reveals the strong propensity of citizens to accept the mandatory nature of membership in mutual
263 health insurance. If the declared rate is high, it poses significant implementation challenges and
264 provides avenues for reflection for Senegalese policymakers in their quest for universal health
265 coverage.

266
