Title: Exploring the use of preprints in dentistry

Abstract

Objective: This study aims to assess the use, impact, and dissemination of preprints in dentistry.

Methods: This is a meta-research study with a cross-sectional design. We included preprints published in dentistry, regardless of the year of publication. Searches were performed in the medRxiv.org and Preprints.org platforms and restricted to English. One researcher extracted the data, and another researcher verified data consistency. The following data were extracted: year of publication, country of the corresponding author, number of abstract and full-text views and downloads, Altmetric attention score, whether the preprint was mentioned in other servers such as Twitter and Publons, number of mentions in other servers, number of citations in the Dimensions database, and whether the preprint had already been published in a peer-reviewed journal. If already published, we extracted the journal's impact factor (JCR 2021) and the number of citations in the Dimensions database. We conducted a descriptive analysis of the extracted characteristics and explored relationships between metrics using the Spearman correlation.

Results: We identified 276 preprints. Most of the studies were published between 2020 and 2022 ($n = 229$), especially those from ten countries. The most-cited preprint and published article are the same study. Only the correlation between the number of preprint citations and peer-reviewed article citations in the Dimensions database showed a large positive association (Spearman's $\rho = 0.5809$).

Conclusion: Preprints gained popularity over the last several years due to the COVID-19 pandemic and reached a larger audience, especially on platforms such as Twitter.

Clinical Significance: Preprint publishing allows faster dissemination of science for the benefit of society.

Keywords: Open science; Research practices; Platforms.

Introduction

Traditionally, research has been communicated through scientific journal articles. The publishing process involves many steps, including peer-review of the manuscript by other researchers [1]. Bjork et al. [2] highlighted that the time between submission and article acceptance can be as long as six months; however, average publication times in disciplines such as business and economics can be longer. This long publication process might not provide the prompt, science-based solutions needed for real-life problems. Additionally, in critical global emergencies, such as the COVID-19 pandemic, faster responses by the academic community are necessary, and, in that scenario, preprints could be essential[3] .

Preprints are initial versions of research manuscripts that have not been peer-reviewed and are publicly available through various platforms, such as medRxiv.org, Preprint.org, and bioRxiv.org [3]. Preprints are not a new publishing format and have been used for over 30 years, but their use has increased recently [3], mostly due to COVID-19. Fraser et al. determined that more than 30,000 research articles related to COVID-19 were posted on preprint servers [3]. The main benefit of preprint publishing is the possibility of accelerating the use of science for the benefit of society[4] . However, widespread use of preprints could involve sharing articles with methodological flaws or biases[5].

As the use of preprints has increased, many discussions have occurred in the literature about the advantages and disadvantages of preprints [4–7]. In dentistry, no study to date has explored the use of preprints. Thus, our objective is to assess the use, impact, and dissemination of preprints in dentistry.

Material and methods

Study design and protocol

This is a meta-research study with a cross-sectional design. The study protocol is available through the link <https://osf.io/6hpdj>.

Eligibility criteria

We included preprints published in dentistry and oral medicine, regardless of the year of publication. We used the definitions of dentistry and oral medicine as determined by the preprint platforms[8,9]. Preprints were considered preliminary reports of work that have not undergone peer review.

Search and screening

Searches were performed in the medRxiv platform, a preprint server for health sciences, through the subject area “Dentistry and Oral Medicine” and the Preprints platform through the subject area “Dentistry.” The medRxiv platform allows authors to post research articles, systematic reviews and meta-analyses, clinical research design protocols, and data articles. The Preprints server publishes articles in the following categories: article, review, conference paper, data descriptor, essay, brief report, case report, communication, short note, technical note, and hypothesis. We did not restrict our search based on date; however, only articles published in English were considered. Searches were performed in November 2022.

After identifying preprints in these platforms, all records were uploaded to Mendeley reference management software.

Data extraction

First, we selected ten studies for a pilot test of data extraction to ensure consistency in interpretation of items. During the pilot test, the reviewers involved in this phase of the study discussed all data to be extracted. Subsequently, one reviewer extracted the data, and another reviewer verified data consistency. In the case of a doubt or inconsistency, the data were extracted again. The following data were extracted: year of preprint publication, country of the corresponding author, number of full-text views and downloads, Altmetric attention score, whether the preprint was mentioned in other servers such as Twitter and Publons, number of mentions in such servers and in which platform the preprint was mentioned, whether the preprint had already been published in a peer-reviewed journal (based on the preprint server information), and number of citations in the Dimensions database. If already published, we also extracted the number of citations of the article in the Dimensions database and the journal's impact factor (JCR 2021). We chose the Dimensions platform because it includes preprints from several sources (including medRxiv and Preprints) and their respective citation counts. Data extraction was performed in November 2022.

Finally, during data analysis, we decided to collect the Altmetric score and the number of mentions on other platforms for the ten most-cited articles to determine whether the attention received in an academic setting (through the number of citations) was comparable to that received on online platforms, such as Twitter and Publons.

Data analysis

We conducted a descriptive analysis of the extracted characteristics. Categorical variables are presented as proportions, and numerical variables are summarized by their means and standard deviations. In addition, we assessed the most-cited preprints and articles in the Dimensions database as well as their Altmetric score and the number of mentions in other servers such as Twitter and Publons. The Shapiro-Wilk test was used to assess the normality of numeric data. We performed Spearman correlation tests to determine the relationship between the number of peer-reviewed article citations in the Dimensions database and the following: the number of preprint citations in the Dimensions database, the number of preprint views (the number of full-text views and downloads), the preprint Altmetric score, and the number of mentions on other servers. The analyses were conducted using Stata 14.0 software (Stata Corp., College Station, TX, USA).

Results

Table 1 summarizes the characteristics of the preprints reviewed. We identified 276 preprints: 131 published in the Preprints server and 145 in the medRxiv server. The list of included preprints is presented in the Supplemental Material. Most of the preprints were deposited between 2020 and 2022 ($n = 229$). Ten countries produced 60.14% of preprints; the USA produced the largest number, with 43 preprints (15.58%), followed by the United Kingdom, with 25 preprints (9.06%). Forty countries published three or fewer preprints, for a total of 60 (21.74%). One hundred thirty-five preprints (48.9%) were subsequently published in peer-reviewed journals, most often in 2021 and 2022 ($n = 92$; 65.15%).

Table 2 presents the metrics related to preprints and peer-reviewed journal articles. Preprints received a mean of 874 full-text views ($SD = 970.7$). Most preprints were mentioned on other platforms ($n = 230$; 83.33%), including 214 preprints (93%) that were mentioned at least on Twitter. In addition, the mean number of preprint citations in the Dimensions database was lower than that of article citations in the same database.

Table 3 lists the most-cited preprints and peer-reviewed articles. The most-cited preprint and most-cited article are the same study, which assessed saliva as a candidate for COVID-19 diagnostic testing [10]. In addition, five preprints included in this list of

most-cited preprints are also included in the list of most-cited peer-reviewed articles [10–14]. Most of the articles included in both lists are COVID-19–related studies. The most-cited preprints and articles did not necessarily have higher Altmetric scores or mentions on other platforms.

Table 4 presents the results of the correlation tests. Only the relationship between the number of preprint citations in the Dimensions database and the number of peer-reviewed article citations in the same database showed a large positive association (Spearman's rho = 0.5809).

Discussion

This is the first study to explore the use of preprints in dentistry. The importance of preprint publishing has been increasing over the last several years due to the need to accelerate the application of science to benefit society, especially during the COVID-19 pandemic. Considering the widespread use of preprints, it is important to understand the impact of this method of publishing on a dentistry science audience. Some findings are important to highlight: (1) preprints gained an audience on platforms such as Twitter, (2) studies subsequently published in peer-reviewed journals tended to receive more citations than they did in preprint format, (3) the most-cited preprints and articles did not necessarily gain more attention on other platforms, and (4) the number of preprint citations could be an indicator of future article citations.

Rapid dissemination of information seems to be the main benefit of preprints [15]. In this context, sharing preprints on Twitter could engage a larger audience [3]. Indeed, we found that most preprints we reviewed were mentioned on Twitter, and the mean number of mentions on other platforms (such as Twitter and Publons) and the Altmetric score were 8.2 and 4.1, respectively. In addition, the most-cited preprints and articles did not necessarily earn higher Altmetric scores or mentions on other platforms, demonstrating that the interests of scientists and the broader public might differ. Fraser et al. found similar results when considering preprints of COVID-19 research in the first ten months of the pandemic [3]. Furthermore, three recent studies have revealed that journal articles that were previously posted on preprint servers received more attention, in terms of citations and Altmetric scores, than articles not previously posted, highlighting another advantage of the use of preprints [16–18]. Finally, it is important to emphasize that a high number of citations does not necessarily indicate high quality [19].

The lack of quality assurance is the main concern associated with preprints, especially because no peer-review process is involved [15]. As would be expected given this concern, we found that, while the numbers of preprint citations and peer-reviewed article citations were significantly positively correlated, the mean number of preprint citations was lower than that of article citations. In other words, scientists prefer to cite published articles over preprints, maybe due to the benefits of peer review. However, we should note that there is a slight quality increase between preprints and the subsequent peer-reviewed articles [20], and the current peer review process does not ensure the publication of high-quality articles [19]. Furthermore, there is an ongoing discussion of whether the peer-review process actually produces higher-quality science [19].

Another critical barrier to using preprints is a lack of knowledge about the process [21]. In a recent study, a high number of survey respondents indicated that they did not post research results in preprint servers because they did not know it was a possibility[21]. The study found that this response was most common among female authors, early-career researchers, and non-US-based researchers[21]. These findings highlight the importance of our study and the need for better communication about the advantages of preprints.

We did not explore preprints separately by subject; however, we noted that preprints gained popularity over the last several years. This increase is likely due to the COVID-19 pandemic, as evidenced by the prevalence of studies about COVID-19 among the most-cited preprints and articles and by the publication of most of the preprints between 2020 and 2022, during the pandemic. Fraser et al. highlighted the importance of preprints in disseminating knowledge to academic and non-academic audiences during the COVID-19 pandemic[3].

Our study had several limitations. First, we searched only two preprint databases and included only articles published in English, so the results may not be generalized to other databases and languages. Second, we did not perform the data extraction in duplicate; however, a pilot test was performed to minimize errors, and one author reviewed possible data inconsistencies. Third, we did not assess the preprints based on subject because our goal was to gain a broad understanding of preprints in dentistry.

Finally, more studies assessing the barriers preventing researchers from posting preprints and the attitudes of researchers toward data from preprints are necessary. In

addition, it is crucial to consider different research areas and how they might vary in researchers' attitudes toward and knowledge of using preprints.

Conclusion

Preprints gained popularity over the last several years due to the COVID-19 pandemic and reached a larger audience, especially on platforms such as Twitter. In addition, studies published in peer-reviewed journals tended to receive more citations than in preprint format, but the number of preprint citations might predict future article citations.
