WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

24 **Abstract**

25 **Introduction.** Physical activity (PA) promotion among school-aged youth is a global health
26 priority. Recommendations for such promotion include implementing whole-of-school
27 approaches that maximize resources across the school environment. This study examined
28 schools' participation in an annual, government-led, and emirate-wide initiative in Dubai,
29 called the Dubai Fitness Challenge, in which the goal is to accrue 30 minutes of PA every day
30 for 30 days (as such, the initiative is colloquially referred to as "Dubai 30x30"). **Methods.** A
31 mixed-methods design was employed for this study. Three schools were recruited using
32 convenience sampling. Participants were 18 physical education teachers, 20 classroom
33 teachers, 2 principals and 45 students. Data sources included surveys, focus groups, and
34 interviews. Data were analyzed using descriptive statistics, multinomial logistic regression,
35 and open and axial coding to develop themes. **Results.** School staff reported that most Dubai
36 30x30 activities were provided in physical education, at break times during school, and
37 before and after school. Students reported that they mainly participated in Dubai 30x30
38 activities during physical education and occasionally participated in activities after school
39 and on weekends. During school, students were more likely to reach higher PA intensity
40 levels when they were in contexts other than the regular classroom setting. Among school
41 staff, physical education teachers were most involved and classroom teachers were least
42 involved in promoting Dubai 30x30. Parent engagement was high. Staff perceived that Dubai
43 30x30 brought the community together, but physical education teachers also indicated there
44 was a lack of implementation guidance and they felt burdened. Participants believed Dubai
45 30x30 increased PA participation and helped to promote their schools. **Discussion:** This
46 study provides an initial glimpse into schools' participation in Dubai 30x30 and suggests that
47 a whole-of-school PA lens is useful in gleaning information that could help to increase and
48 optimize PA opportunities for students.

73

74 **Introduction**

75 Physical activity (PA) benefits children and adolescents by supporting their physical,
76 mental, social, and emotional development (Chaput et al., 2020). The World Health
77 Organization (WHO) recommends that school-age youth engage in at least 60 minutes of
78 moderate-to-vigorous intensity PA each day (WHO, 2020). This PA should be mostly aerobic
79 and should include activities that strengthen muscles and bones at least three days per week
80 (WHO 2020). Unfortunately, 81% of adolescents do not meet PA guidelines (Guthold et al.,
81 2020). As physical inactivity can track from adolescence into young adulthood (Hayes et al.,
82 2019; Telama, 2009), early intervention during the school years should be a priority for
83 addressing insufficient PA levels in youth and promoting active living.

84 Given their extensive reach and existing resources, schools provide an attractive setting
85 for supporting children and adolescents' PA needs. Recommendations stress the importance
86 of taking a "whole-of-school approach" to PA promotion (Global Advocacy for Physical
87 Activity, 2012; Institute of Medicine [IOM], 2013; Milton et al., 2021). Such an approach
88 may look different from one school to the next but the general idea is to maximize PA
89 opportunities and participation by using as many resources as possible before, during and
90 after school. For example, the comprehensive school physical activity program (CSPAP)
91 framework, which is the national framework for school-based physical education and PA in
92 the United States, identifies five components that can be used synergistically to help ensure
93 all school-aged youth meet the PA guidelines and develop the competence and confidence to
94 lead physically active lives (Centers for Disease Control and Prevention, 2019). These
95 components include (a) quality physical education, (b) PA during school, (c) PA before and
96 after school, (d) staff involvement and (e) family and community engagement. A quality
97 physical education program should serve a foundational role in a CSPAP by providing
98 students with the knowledge and skills to pursue a physically active lifestyle. Other PA

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

99 opportunities during school (e.g., recess and other break times, PA integrated with classroom
100 time), as well as PA opportunities before and after school (e.g., clubs, active transportation),
101 can allow students to apply and extend what they learn in physical education. The staff
102 involvement and family and community engagement components focus on recruiting the
103 support of as many other people as possible (e.g., all teachers, school administrators, parents,
104 community partners) to assist with PA promotion.

105 Evidence suggests that a whole-of-school approach to PA promotion leads to positive
106 outcomes for school-age youth (Belton et al., 2020; Colabianchi et al., 2015; Katewongsa et
107 al., 2022; Pulling Kuhn et al., 2021). For example, Pulling Kuhn et al. (2021) conducted a
108 systematic review of multicomponent school-based PA interventions and found that reported
109 outcomes included increased time spent in PA, increased physical fitness, improved motor
110 skills, improved weight status, improved blood pressure, improved on-task behavior and
111 improved performance in reading and math. However, surveys conducted in the U.S. indicate
112 whole-of-school PA programs exist in only 16% of elementary schools and 1-7% of
113 secondary schools (American Alliance for Health, Physical Education, Recreation and Dance
114 [AAHPERD], 2011; Brener et al., 2017; Colabianchi et al., 2015). In Ireland, a national
115 initiative with primary (elementary) schools called Active School Flag has had more success
116 with 85% of schools engaging at some level with the initiative and 46% of schools earning at
117 least one flag (i.e., meeting criteria to be named an “active school”).

118 The varying uptake of whole-of-school PA underscores the importance of examining
119 schools’ implementation of current initiatives. Carson et al. (2014) proposed a conceptual
120 framework for research and practice related to whole-of-school PA, which is based on
121 ecological systems theory (Bronfenbrenner, 1992; McLeroy et al., 1988). The framework is
122 organized into multiple levels of influence on the implementation of a whole-of-school PA
123 initiative and, ultimately, on youth PA. Specific to implementation, the most proximal level

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

124 of influence is the Meso level. This level consists of implementation facilitators, including
125 the knowledge, skills, and dispositions of the implementers (e.g., school personnel), as well
126 as resources (e.g., school facilities, equipment, time, and space allocation) and safety
127 (physical, social, and emotional) regarding PA opportunities. Above the Meso level is the
128 Exo level, which comprises the leaders of whole-of-school PA initiatives: a champion
129 (someone who spearheads the initiative), the school administrative team (i.e., their support
130 for the initiative) and a school committee dedicated to the initiative. Finally, the Macro level
131 incorporates cultural elements of the school in relation to PA promotion. These elements
132 include policy (e.g., PA-related legislation, monitoring and evaluation of the initiative) and
133 normative behaviors and beliefs (e.g., shared expectations and values of members of the
134 school community).

135 Research on whole-of-school PA implementation has identified numerous factors that
136 align with all levels of influence in Carson et al.'s (2014) conceptual framework. These
137 factors include public policies (e.g., state mandates related to whole-of-school PA; Phelps et
138 al., 2018), school culture (e.g., prioritizing PA amid the pressures of academic testing, PA
139 role-modelling by school staff, celebrating PA participation; Cassar et al., 2022; Ní Chróinín
140 & McMullen; 2020), program leadership (e.g., a person who champions the initiative;
141 McMullen et al., 2022), administrative support (e.g., providing teachers with PA promotion
142 resources, allowing for teacher autonomy in program implementation, administrators role-
143 modelling PA; Cassar et al., 2022; Phelps et al., 2018), facilities (e.g., physical education
144 facilities, bike racks that support active commuting), (Phelps et al., 2018), knowledge and
145 beliefs related to PA promotion (Cassar et al., 2022) and the availability of many PA
146 opportunities (McMullen et al., 2022). Such research is critical to informing ongoing and
147 future efforts to maximize the implementation of whole-of-school PA initiatives.

148 In parallel with global trends, 81% of children and adolescents in the United Arab
149 Emirates are not accumulating at least 60 minutes of moderate-to-vigorous PA each day
150 (Alrahma et al., 2023). One initiative that may help to address this issue is the Dubai Fitness
151 Challenge. Since 2017, the Dubai government has implemented the Dubai Fitness Challenge
152 (also referred to as Dubai 30x30) annually with the goal of engaging Dubai residents in 30
153 minutes of fitness activities for 30 days (late October through late November). Numerous
154 activities are organized throughout the month, such as a half marathon, a bicycle ride, sports
155 competitions, video workouts and free fitness classes. According to the Khaleej Times (citing
156 data from Dubai's Department of Economy and Tourism) there were 786,000 participants in
157 the first year of the event's implementation and 1.6 million participants in 2021 (close to half
158 of Dubai's total population) and 88% of those who participated in 2021 reached the 30/30
159 goal.

160 Though not a requirement, Dubai schools are strongly encouraged to participate in
161 Dubai 30x30. Some media attention has been given to reporting various kinds of activities
162 that schools implement during the initiative and the benefits of the initiative according to
163 physical education teachers ("Dubai Fitness Challenge", 2022; Roberts, 2022; "Schools Get
164 Moving", 2022). Examples of activities include partnering with community
165 organizations/companies to offer different sports, games, and fitness events, taking field trips
166 (e.g., to the beach) to exercise, having students use activity passports or scorecards to
167 incentivize participation, and engaging school staff and parents in activity participation.
168 Reported benefits include students wanting to continue doing activities they were introduced
169 to throughout the month and parents' enjoying participation in the initiative. Despite these
170 media portrayals of Dubai 30x30 implementation in schools, there is a lack of research that
171 examines such implementation. No studies have investigated schools' implementation of the
172 initiative from the perspective of whole-of-school PA promotion, which is essential for

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

173 helping school leaders (e.g., government officials who oversee the education sector in Dubai,
174 school administrators) optimize Dubai 30x30 implementation using available school and
175 community resources. The purpose of this study, therefore, was to examine schools'
176 implementation of Dubai 30x30 through a whole-of-school PA lens. As this was the first
177 study to investigate schools' implementation of Dubai 30x30, we opted to approach the study
178 in a broad and exploratory manner by asking the following research questions: (a) What was
179 the extent and nature of Dubai 30x30 activities for students, staff, and families before, during
180 and after school? (b) To what extent did students participate in Dubai 30x30 activities? (c)
181 How did students' PA levels during school relate to contextual variables? (d) To what extent
182 and in what ways were staff, families and community partners involved/engaged in
183 promoting Dubai 30x30? (e) What were the perceived successes and challenges involved
184 with implementing the initiative? and (f) What was the perceived impact of implementing the
185 initiative on students, staff, families, and the community?

186 **Materials and Methods**

187 **Research Design**

188 This descriptive study was conducted using a convergent parallel mixed-methods
189 research design (Edmonds & Kennedy, 2017). Specifically, quantitative and qualitative data
190 were collected concurrently and analyzed jointly to address the research questions.

191 **Participants and Setting**

192 Convenience sampling was used to recruit three private international schools in Dubai
193 to participate in the study. Each school follows a British curriculum. The first school (School
194 1) serves students ages 3-11 and the second and third schools (School 2 and School 3) serve
195 students ages 3-18. School 1 opened in 1989, School 2 opened in 2015 and School 3 opened
196 in 2021. At the time of this study, more information was available for Schools 1 and 2 than
197 for School 3 because the first two schools had undergone government inspections and reports

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

198 of the inspection results were publicly available online, whereas the third school had not yet
199 been inspected. School 1 had a total enrollment of 1177 students and a teacher-student ratio
200 of 1:15. School 2 had a total enrollment of 1020 students and a teacher-student ratio of 1:8.
201 School 3 had a total enrollment of 1290 students but there was no information available about
202 teacher-student ratio. The largest nationality group of students at School 1 was UK, while the
203 largest nationality group of students for School 2 was European. There was no information
204 available about students' nationalities for School 3. For the 2022-2023 school year, the Dubai
205 government rated School 1 as "outstanding" and School 2 as "very good." These ratings
206 encompass numerous areas of focus, such as students' achievement, personal and social
207 development, teaching and assessment, staffing, facilities, and other resources. While School
208 3 had not yet received a rating, our visits to the school led us to believe that the learning
209 climate and availability of resources were similar in quality compared to the first two schools.

210 Participant details from each school are displayed in Table 1. There were four
211 participant groups: students, physical education teachers, classroom teachers and principals.
212 Participation is reported in terms of the number of individuals from each participant group
213 who participated in each method of data collection (survey, observations, and focus
214 groups/interviews; see the following section on data sources and procedures). In all, there
215 were 78 survey participants, 15 classes that were observed and 29 focus group/interview
216 participants. Age bands for the different school years (grades) are 5-6 for Year 1, 6-7 for Year
217 2, 7-8 for Year 3, 8-9 for Year 4, 9-10 for Year 5, 10-11 for Year 6 and 11-12 for Year 7.

218 Table 1

219 *Participant Details*

Students	7	57%	43%	13.25 (0.71)

220 Note: NR = Not reported.

221 **Data Sources and Procedures**

222 The Ethics Board at the [REDACTED] approved this study. School and
 223 participant recruitment was conducted from August 8th, 2022 to January 30th, 2023.

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

224 Participants provided written informed consent prior to the start of data collection.
225 Parents/guardians provided consent for student participants. Data sources for this study
226 included surveys, school observations, focus groups and individual interviews. The surveys
227 and school observations provided quantitative data, while the focus groups and individual
228 interviews provided qualitative data. A physical education teacher at each school served as
229 the point of contact during the study and helped to recruit participants and facilitate data
230 collection.

231 **Surveys.** Schools 2 and 3 participated in electronic surveys that were administered
232 over a three-week period directly following Dubai 30x30 (School 1 opted not to participate in
233 the surveys). The online survey platform JISC was used to create and distribute the surveys
234 and manage the data. Weekly reminders were sent via email to increase the number of survey
235 respondents. There were four surveys: one for students, one for physical education teachers,
236 one for classroom teachers and one for principals. Students completed their survey during
237 normal classroom time and with assistance from teachers, as needed.

238 Survey items pertinent to the current study focused on Dubai 30x30 activities before,
239 during and after school (Research Question 1), students' participation in these activities
240 (Research Question 2) and school staff's involvement in Dubai 30x30 (Research Question 4).
241 Regarding Dubai 30x30 activities, school staff were asked to indicate the extent to which
242 activities were provided in each of six contexts (physical education, classroom, recess/break,
243 before school, after school, and weekends), whereas students were asked to indicate their
244 level of participation in these activities. A six-point response scale was used. The response
245 scale for school professionals ranged from "No Dubai 30x30 activities were provided" to "A
246 lot of Dubai 30x30 activities were provided." Participants could also choose an option that
247 stated, "I don't know where there were any Dubai 30x30 activities provided." The response
248 scale for students ranged from "I did not participate at all in Dubai 30x30 activities" to "I

249 participated a lot in Dubai 30x30 activities.” Students could also choose the option, “There
250 were no Dubai 30x30 activities provided.”

251 Items assessing staff involvement were adapted from existing measures developed in
252 previous whole-of-school research (Orendorff et al., 2021; Stoepker et al., 2021; Webster et
253 al., 2013). Example items include “I am involved with Dubai 30x30 planning at my school”
254 (asked to all school staff), “I am involved with integrating Dubai 30x30 activities into
255 physical education lessons” (asked only to physical education teachers), “I am involved with
256 integrating Dubai 30x30 activities into my classroom lessons or as breaks/transitions during
257 normal classroom time” (asked only to classroom teachers) and “I am involved with
258 allocating resources for my school’s participation in Dubai 30x30” (asked only to principals).
259 A six-point response scale was used, which ranged from “Strongly Disagree” to “Strongly
260 Agree.”

261 The surveys also included a demographic section at the end. All participants were
262 asked to identify their gender and their race/ethnicity. Additionally, students were asked to
263 identify their age, while school staff were asked to indicate the levels at which they were
264 teaching (e.g., elementary, secondary). An optional response format was used for all items on
265 the surveys so that participants could skip questions if they wished to do so.

266 **Observations.** The Observational System for Recording Physical Activity in Children
267 – Elementary School (OSRAC-E; McIver et al., 2016) was used to examine the relationship
268 between students’ PA levels and contextual variables during school (Research Question 3).
269 Although the instrument was designed for elementary school settings, much of the category
270 system can be applied to secondary school settings, as well. Five categories from the
271 instrument were used for the purposes of the present study: activity level, location, physical
272 setting, instructional setting, and activity context. OSRAC-E uses a focal child protocol,
273 whereby a single child is observed at a time using momentary time sampling. We employed a

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

274 five-second observe interval followed by a 25-second record interval, which was repeated for
275 five minutes with the same child. This observation procedure was used with as many children
276 as possible during each school visit during the study.

277 In the week before observations were scheduled to commence, the second author
278 conducted a two-hour training session on the observation protocols used for the study.
279 Trainees were undergraduate students who volunteered to help with data collection and other
280 aspects of the research. The session involved familiarizing the trainees with the OSRAC-E
281 and testing the trainees' reliability in using the instrument. Inter-observer reliabilities were
282 calculated using the following formula (van der Mars, 1989):

$$\frac{\text{Number of Agreements}}{\text{Number of Agreements} + \text{Disagreements}} \times 100 = \% \text{ Agreement}$$

283 Video examples were used for the training and to test inter-observer reliability. A reliability
284 standard of 80% was considered acceptable (van der Mars, 1989). Total of eight trainees
285 demonstrated acceptable inter-observer agreement proceeded with conducting observations
286 the following week.

287 A second two-hour training session was held after the first week of data collection to help
288 prevent observer drift and address any unanticipated challenges with data collection. During
289 this session, observers shared their experiences doing the observations and suggested ways to
290 help increase inter-observer reliability. Suggestions mainly focused on how to record unusual
291 activities or types of behavior using the OSRAC-E. The session also included additional
292 opportunities for observers to practice using the using more video examples and concluded
293 with another round of reliability testing, which resulted in acceptable levels of agreement
294 (above 80%) for all observers.

295 Observations were conducted across 15 classrooms from Schools 2 and 3 during the
296 full month of Dubai 30x30 (School 1 opted not to participate in the observations).
297 Observation days and times were scheduled in accordance with when the observers were
298 available and when the schools were able to accommodate observers. In total, observations
299 were conducted for 10.25 hours across 12 days. During each school visit, observers usually
300 stayed with a single class of students and followed the class during the full observation period
301 (approximately 2-7 hours). This allowed for data to be collected in different instructional
302 contexts (e.g., homeroom, physical education). Observation shifts lasted two and a half hours
303 for each observer to help prevent exhaustion and loss of focus. Additional inter-observer
304 reliability checks were conducted in the third and fourth weeks of data collection with
305 agreement scores indicating acceptable reliability.

306 **Focus groups and interviews.** A total of six focus groups and two individual
307 interviews were conducted (see Table 1 for participant details). The purpose of the focus
308 groups and interviews was two-fold. First, they were intended to provide additional
309 information about Dubai 30x30 activities (Research Question 1) and the
310 involvement/engagement of school staff, families, and community partners in promoting
311 Dubai 30x30 (Research Question 4). Second, they were designed to address school staff's
312 perceived successes and challenges involved with implementing Dubai 30x30 (Research
313 Question 5) and participants' perceived impact of the initiative on students, families, and the
314 community (Research Question 6). A semi-structured format was used to allow for some
315 flexibility in each focus group/interview. Examples of questions include "What did your
316 school do in the name of Dubai 30x30 this school year?", "Describe your involvement in
317 Dubai 30x30 this school year as a physical education/classroom teacher/principal. What roles
318 did you play?", "From your perspective, what were notable successes for your school during
319 its involvement with Dubai 30x30 this school year?", "Describe any challenges or problems

320 you remember from your school’s involvement with Dubai 30x30 this school year?” and
321 “What was the impact of your school’s involvement in Dubai 30x30?” Additionally, prompts
322 were used for clarification and to explore participants’ responses in more depth. Following
323 recommended protocols, two researchers conducted each focus group with one researcher
324 asking questions and the other researcher taking notes and helping to moderate, when needed
325 (Krueger & Casey, 2014). Interviews/focus groups generally lasted 30 minutes, were
326 conducted either in person at participants’ schools or online via Zoom and were audio
327 recorded.

328 **Data Analysis**

329 **Surveys.** Microsoft Excel was used to calculate descriptive statistics, including means
330 and standard deviations, for the extent of Dubai 30x30 activities before, during and after
331 school (Research Question 1), the extent of students’ participation in Dubai 30x30 activities
332 (Research Question 2) and the extent of involvement/engagement of school staff in
333 promoting Dubai 30x30 (Research Question 4).

334 **Observations.** To examine the relationship between students’ PA and contextual
335 variables during school (Research Question 3), the likelihood of students engaging in each
336 activity level was estimated using multinomial logistic regression with students engaging in
337 stationary as the referent group. Analyses were completed using STATA (v.16.1, STATA
338 Corporation LLC, College Station, TX).

339 **Focus groups and interviews.** All audio recordings were transcribed verbatim for
340 analysis. Open and axial coding were used to develop themes in the data (Strauss & Corbin,
341 1990). Specifically, the first author read each transcript to become familiar with participants’
342 responses. Then, he initiated open coding, which involved writing memos that
343 summarized/interpreted the responses (or parts of responses) in each transcript that seemed
344 helpful in addressing Research Questions 1, 4, 5 and 6. This process continued iteratively,

345 allowing for revisions and additions to the memos as the author made additional passes
346 through the transcripts and developed his understanding of the major ideas underlying the
347 data. Subsequently, the author used axial coding to search across transcripts for memos
348 suggesting similar ideas. He synthesized these memos into broader ideas related to each
349 research question to develop themes. To help ensure trustworthiness (Lincoln & Guba, 1985),
350 the second author served as a peer debriefer throughout the analysis, regularly meeting with
351 the first author to discuss the analysis process, the coding, and the themes. Trustworthiness
352 was also established through the triangulation of multiple data sources.

353 **Results**

354 **Research Question 1: Dubai 30x30 Activities Before, During and After School**

355 Descriptive statistics and themes related to Research Question 1 are shown in Table 2.
356 School staff indicated on their surveys that there were more Dubai 30x30 activities provided
357 during physical education than in other contexts. Recess/other breaks during school and
358 before and after school periods were also identified as times when there were a fair amount of
359 Dubai 30x30 activities provided. Participants felt that there were very few Dubai 30x30
360 activities provided during classroom time and on weekends. Themes and supporting evidence
361 from the focus group and interview data are presented in Table 3. The themes converged with
362 the survey data in that all participant groups (physical education teachers, classroom teachers
363 and students) and the principal spoke about Dubai 30x30 activities that were offered during
364 break times and before and after school. There was also a theme characterized by a recurring
365 competitive element to many of the activities. Surprisingly, physical education was seldom
366 mentioned in relation to Dubai 30x30 activities, which contrasted with the survey data.

373 *Research Question 1: Extent and Nature of Dubai 30x30 Activities Provided Before, During*
 374 *and After School (Themes and Supporting Evidence from Focus Group and Interview Data)*

Theme	Supporting Evidence
Break Time	<p>“During break times we had opportunities for students to take part in organized activities, so we opened the [sports facilities] to the year sevens so they could participate in various activities such as football, basketball, and netball” (PE Teacher 3, School 1)</p> <p>“So, we had, like Miss Stanley would often go out, and [put] the music on [at] lunchtime. We’d have a chance to like, dance and get active” (Classroom Teacher 1, School 3)</p> <p>“We did daily activities with the children. Those were done at break time options, with different Dubai 30 activities” (Principal, School 3)</p> <p>“There were cool [activities]...at break times there were many teachers and basketball kinds of stuff” (Student 1, School 2)</p>
Before and After School	<p>“Before school, we had the various activities that relate to PE and sport...we had swimming...there was netball as well, athletics down at the stadium, there was</p>

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

golf also...rugby, football, fitness, yeah, the fitness sessions for the staff as well, fitness session for the students, for parents...there were swimming activities also”

(PE Teacher 3, School 3)

“So, our clubs start at 6.45. So, and that takes us up then to registration. So, we [were] there was Monday, Tuesday, Wednesday, Thursday, Friday. There was something on every day and then at 7.30 I would go and do the Wake Up, Shake Ups twice a week as well” (PE Teacher 1, School 1)

When asked to discuss some of the activities taking place after school, PE Teacher 1 from School 3 said the following “Netball, basketball, rugby, football, table tennis, tennis, football, skiing, taekwondo, jujitsu, karate, gymnastics, acro dance, musical theatre, ballet and that is most of the activities run from FS all the way through to year 7”

“We had a color run thing at school with the parents that involved, and one evening as well” (Classroom Teacher 1, School 3)

Competitions

PE Teacher 1 from School 3 who said “So we try and get them involved in a competition format as well” (PE Teacher 1, School 3)

“We obviously did a competition as well, so those that did, you know, complete the diaries the most we gave them T-shirts, and we just made a big song and dance of it in assembly” (PE Teacher 1, School 2)

“[Students] also get awards within the classroom for [participation] as well. But they’re also included within the house reward system. So, house points” (PE Teacher 3, School 3)

“We had a full competition with the diary daily. So, the children could, if they took part in that Dubai 30 challenge...they recorded it in a journal, and then [submitted] that into the PE Team Department. I can't (remember) the prize what they got for that, house points, I think” (Classroom Teacher 3, School 3)

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

“There was quite a lot of challenges going on as well” (Classroom Teacher 1, School 3)

“There was this one dance competition in school between houses like we had to like, choose which house that's the best and it was on the field” (Student 1, School 2)

When asked what gets him excited about participating in Dubai 30x30, Student 2’s (School 2) immediate response was “Competition”

375

376 **Research Question 2: Students’ Participation in Dubai 30x30 Activities**

377 Table 4 displays the descriptive statistics related to Research Question 2. Consistent
 378 with school staff’s survey responses regarding the extent of Dubai 30x30 activities provided
 379 in different contexts, students reported participating a fair amount in Dubai 30x30 activities
 380 during physical education and very little in such activities during classroom time. However,
 381 in contrast to the school staff survey data, students indicated they participated very little in
 382 Dubai 30x30 activities during recess/other break times and occasionally participated in
 383 initiative-related activities after school and on weekends.

384 Table 4

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

Research Question 3: Relationship between Students' PA Levels and Contextual

Variables During School

Results of the multinomial logistic regression models are presented in Table 5. Several physical setting variables were related to students' engagement in activity. For example, children were 2.39 (95CI=1.08, 5.28) and 52.36 (95CI=13.12, >100.00) times as likely to engage in slow easy and fast activity in the gym compared to the classroom. Further, the playground, sports fields and other physical settings showed similar relationships with children's physical activity. At the playground children were 6.02 (95CI=2.02, 17.92), 6.48 (95CI=3.49, 12.02) and 110.66 (95CI=31.34, >100.00) times as likely to engage in slow easy, moderate, and fast activity compared to the classroom. At the sports field children were 5.69 (95CI=2.65, 12.02), 4.86 (95CI=1.85, 12.77) and 55.34 (95CI=12.52, >100.00) times as likely to engage in slow easy, moderate, and fast activity compared to the classroom. In other physical settings children were 9.81 (95CI=3.06, 31.50), 6.91 (95CI=1.92, 24.95) and 36.90 (95CI=3.15, >100.00) times as likely to engage in slow easy, moderate, and fast activity compared to the classroom. In the multipurpose room children were 4.19 (95CI=2.05, 8.58) and 4.59 (95CI=1.81, 11.66) times as likely to engage in limbs and slow easy, but <0.00 (95CI= <0.00, <0.00) times as likely to engage in both moderate and fast activity when compared to the classroom.

390

391

392

393

394

395

396

Location, instructional setting and activity context were also related to children’s activity level. Children were 4.40 (95CI=2.40, 8.09), 4.13 (95CI=1.99, 8.57), and 6.55 (95CI=2.54, 16.92) times as likely to engage in slow easy, moderate, and fast activity when outside or in transition compared to when they were inside. With respect to instructional setting, children were <0.00 (95CI= <0.00, <0.00) times as likely to engage in slow easy, moderate, or fast activity during lunch compared to core class time. Conversely, during music, children were 3.16 (95CI=1.80, 5.54) and 4.44 (95CI=1.73, 11.40) times as likely to engage in limbs and slow easy activity, but <0.00 (95CI= <0.00, <0.00) times as likely to

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

397 engage in moderate or fast activity when compared to core class time. During physical
398 education, children were 3.47 (95CI=1.76, 6.85), 3.54 (95CI=1.53, 8.19), and >100.00
399 (95CI=18.78, >100.00) times as likely to engage in slow easy, moderate, and fast activity
400 compared to core class time. Similarly, during recess children were 3.14 (95CI=1.21, 8.18),
401 3.84 (95CI=1.52, 9.69), and >100.00 (95CI=15.74, >100.00) times as likely to engage in slow
402 easy, moderate, and fast activity compared to core class time. In other instructional settings,
403 children were 3.52 (95CI=1.10, 11.26) and 46.38 (95CI=3.93, >100.00) s likely to engage in
404 slow easy and fast activity compared to core class time.

405 Regarding activity context, children were 19.83 (95CI=4.75, 82.79), and >100.00
406 (95CI=>100.00, >100.00) times as likely to engage in moderate and fast activity during open
407 space activities compared to academic activities. During teacher organized activities, children
408 were 5.14 (95CI=2.64, 10.01), 15.01 (95CI=4.06, 55.44), and >100.00 (95CI=>100.00,
409 >100.00) times as likely to engage in slow easy, moderate, and fast activity compared to
410 academic activities. Finally, during other activity contexts children were 8.36 (95CI=3.13,
411 22.33), 29.38 (95CI=6.59, >100.00), and >100.00 (95CI=>100.00, >100.00) times as likely to
412 engage in slow easy, moderate, and fast activity compared to academic activities.

413 **Research Question 4: Involvement/Engagement of School Staff, Families and** 414 **Community Partners**

415 Table 6 displays the descriptive statistics related to Research Question 4. Overall,
416 physical education teachers' perceived involvement in promoting Dubai 30x30 was higher
417 than classroom teachers' or principals' perceived involvement. Physical education teachers
418 somewhat agreed that they were involved in integrating Dubai 30x30 activities into their
419 lessons, promoting Dubai 30x30 activities outside of physical education, generating support
420 from others to implement Dubai 30x30 activities, finding solutions to problems with
421 implementing Dubai 30x30 activities, planning Dubai 30x30 activities, organizing Dubai

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

422 30x30 activities, advocating for the school’s involvement in Dubai 30x30 and serving as a
 423 health/fitness role model. Principals’ perceived involvement was second highest overall in
 424 comparison to physical education teachers and classroom teachers. Principals agreed that they
 425 were involved with allocating resources for their school’s participation in Dubai 30x30 and
 426 advocating for their school’s involvement in Dubai 30x30. They somewhat agreed that they
 427 were involved in evaluating the school’s participation in Dubai 30x30, establishing Dubai
 428 30x30 activities at the school, setting performance standards for the school’s participation in
 429 Dubai 30x30, building/maintaining partnerships for implementing/sustaining Dubai 30x30,
 430 planning for Dubai 30x30 implementation and being a healthy/fit role model. Classroom
 431 teachers disagreed/somewhat disagreed about their involvement across all relevant items.

436

437 Themes and supporting evidence related to Research Question 4 are presented in
 438 Table 7. The first theme, “Physical Education Teachers as Dubai 30x30 Leaders,” closely
 439 aligns with the survey data, further demonstrating that physical education teachers were
 440 distinctly involved in schools’ implementation of the initiative. The common approach was
 441 for someone on the physical education team to spearhead the planning and organization of
 442 Dubai 30x30 activities, guide the other physical education teachers in their efforts to support
 443 the implementation of the activities and serve as the primary liaison for other school staff,
 444 parents and any other entities who were involved. The second them focused on parent

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

445 engagement, which mainly entailed parents participating in various activities that the school
 446 provided, some of which were specifically designed for parents.

447 Table 7

448 *Research Question 4: Involvement/Engagement of School Staff, Families and Community*

449 *Partners in Promoting Dubai 30x30 (Themes and Supporting Evidence from School Staff*

450 *Focus Group and Interview Data)*

Theme	Supporting Evidence
Physical Education Teachers as Dubai 30x30 Leaders	<p>“So, I was the Dubai30/30 champion as that, that's what they called the lead role in the school. So, I was the one that coordinated everything in the school basically and just I had my, you know the PE Team. I, I didn't obviously tell them what to do, but anything I needed support with, or I needed them to organise or help with. I would, you know, give them the instructions there, the emails to parents would come from me any communication I would be passing on. So yeah, just to coordinate you just the coordinator of it for your whole school.” (PE Teacher 1, School 3)</p> <p>“[PE Teacher 1, School 3] drove the whole thing...Gave us a set of some guidelines and I'd say most of us chipped in with different ideas. All of us definitely supported the events, things that happened whether it was accompanying the kids on the that trip, whether it was getting involved...in fact all of us helped with the night run, which is a really, from a parental perspective, really launched the whole connection between people – staff and parents – with the 30/30 (PE Teacher 2, School 3)</p>
Parent Engagement	<p>“We did a parent challenge where we ran fitness [activities] at drop off, and children nominated their parents to be part of that... parents [came] in and participat[ed] in our morning runs, and our morning cycles, [and] in the night run.” (Principal, School 3)</p>

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

“The Wake Up, Shake Ups – all the parents coming in and getting involved was lovely, lovely to see.” (PE Teacher 1, School 1)

“A lot of staff got a little bit more motivated to try to get involved with other [activities] because they saw the positive response from the kids and the parents” (PE Teacher 3, School 3)

“My mother and dad are really into Dubai 30x30, and they are also involved” (Student 1, School 2)

451

452 **Research Question 5: School Staff’s Perceived Successes and Challenges of Dubai 30x30**

453 **Implementation**

454 Themes and supporting evidence related to Research Question 5 are presented in
455 Table 8. Implementation successes were described in terms of communities coming together.
456 Implementation challenges were mainly discussed relative to the lack of guidance and the
457 pressures placed on physical education staff.

458 Table 8

459 *Research Question 5: School Staff’s Perceived Implementation Successes and Challenges*

460 *(Themes and Supporting Evidence from School Staff Focus Group and Interview Data)*

Theme	Supporting Evidence
Communities Coming Together	“It was a really good focus to bring the community together” (Principal, School 3) “It’s a good sense of community, really brings everybody together. And there’s such a wide range of activities available, even if you’re not the most sporty person, it’s something that everybody can enjoy” (Classroom Teacher 3, School 3)

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

	<p>“It felt like we were all kind of one big team...all of the staff, the parents and the pupils all participating together. It was nice that we were all working together. Everyone had the same goal of getting the 30 minutes in” (PE Teacher 2, School 3)</p> <p>“I think it makes people come together as a community...it opens up the field for a lot of activities that involve children, parents and staff” (Classroom Teacher 2, School 3)</p>
Lack of Guidance	<p>“There aren’t any set guidelines as to how much a school needs to be doing...there needs to be a little bit more clarity from [the government] as to what the targets for each school [should be] because I know that we did a lot, but then I spoke to another school and they literally just had a poster” (PE Teacher 3, School 3)</p> <p>“I took on [being the Dubai 30x30 champion for the school], not really knowing (being my first year) what I was meant to be doing” (PE Teacher 1, School 1)</p>
Pressures on Physical Education Staff	<p>“It is a big task for just one department to do...It’s a lot lumped into one month...you feel, you know, you’ve got to keep banging that drum in between doing everything you do in your day job anyway” (PE Teacher 3, School 3)</p>

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

“The main challenge for us was just the timing of our daily schedules and the [school inspections by the government] and then trying to do this additionally...I did feel I wanted to do more, and I physically couldn’t because I had not time” (PE Teacher 1, School 1)

“I don’t think we found any challenges [although] it’s just fitting everything into a busy time, isn’t it? That’s the thing” (Principal, School 3)

461

462 **Research Question 6: Participants’ Perceived Impact of Dubai 30x30**

463 The themes and supporting evidence related to Research Question 6 are displayed in
464 Table 9. There were two themes: (a) increased PA and (b) promotion of the school. Many of
465 the statements participants made about the impact of Dubai 30x30 focused on increased PA
466 for youth and parents. Promotion of the school constituted a smaller theme that became
467 apparent within the transcripts from participants at School 3.

468 Table 9

469 *Research Question 6: Perceived Impact of Dubai 30x30 (Themes and Supporting Evidence*
470 *from Focus Group and Interview Data)*

Theme	Supporting Evidence
Increased PA	“I think Dubai 30x30 started my consistency [with exercise] because before, I didn’t really exercise but now I’m more consistent with it” (Student 1, School 2)

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

“I actually started wanting to work out more. I started going to the gym...now I go two times a week. I know it’s definitely affected my brother a lot. He also does gym now. He started like this whole plan and everything. I feel like the things you do and if you find them enjoyable at school you are most likely to do them outside of school” (Student 2, School 2)

“There were children that would come to me and go, ‘Miss, I did this at the weekend’ or ‘I did that at the weekend’ and you know that Dubai 30x30’s inspired them to do that and that wouldn’t have happened maybe before” (PE Teacher, School 1)

“Wake Up, Shake Ups” we still do now. So there’s been a lasting impact” (Classroom Teacher 2, School 3)

“It’s getting back into exercise. I think it’s the timing of the year but also, we had a bike and treadmill at reception and there were a lot of parents that came in and said, ‘I haven’t cycled for years, and I think the impact, you know, we’ve got huge cycle tracks [in Dubai] and [parents] went out and continued. The legacy of the Dubai 30x30 continues afterwards. [People] got back into exercise afterwards” (Classroom Teacher 4, School 3)

Promotion of the School

“...the assemblies and the guests coming in and the stair climbs...it’s just something different.

Yeah, and it’s a good way to promote the school” (PE Teacher 3, School 3)

“Across the whole school, just the optics were very good. Everywhere you looked, you could see posters on the walls. When you walked into reception, there is the cycle bike and there is the treadmill and everything. So, it’s everywhere you went you would just know. If someone came on holiday and they came to visit the school on their first day in Dubai, they’d probably ask ‘What is this 30/30?’” (PE Teacher 2, School 3)

“We have more parental involvement, we have more activities for the children on a daily basis...running through the school with posters on our interactive screens” (Principal, School 3)

471

472

Discussion

473

Consistent with global trends in PA among school-age youth (Guthold et al., 2020),

474

most children and adolescents in the UAE are insufficiently active (Alrahma et al., 2023).

475

The current study drew upon conceptions of whole-of-school PA promotion (CDC, 2019;

476

IOM, 2013; Milton et al., 2021) to examine schools’ participation in Dubai 30x30. To our

477

knowledge, this is the first study to provide descriptive data about implementation and

478

outcomes related to schools’ involvement with Dubai 30x30. We therefore adopted an

479

exploratory approach, driven by several research questions intended to provide an initial

480 glimpse into various aspects of whole-of-school PA. Specifically, this study investigated the
481 scope and nature of Dubai 30x30 activities offered before, during and after school and on
482 weekends; students' participation in Dubai 30x30 activities; the role of school contextual
483 variables in students' PA during Dubai 30x30; staff involvement in promoting Dubai 30x30;
484 staff's perceptions of implementation successes and challenges; and staff's and students'
485 perceptions of the impact of Dubai 30x30. The results of this study contribute to the growing
486 knowledge base internationally on whole-of-school PA approaches, point to potential
487 directions for future research and establish preliminary evidence that can be used to optimize
488 Dubai 30x30 as a lever for increasing and sustaining whole-of-school PA in Dubai schools.

489 **Research Question 1: Dubai 30x30 Activities Provided**

490 School staff reported that most Dubai 30x30 activities were provided in physical
491 education, during school break times and before and after school. This suggests that Dubai
492 30x30 activities spanned many of the contexts identified in whole-of-school PA
493 recommendations (CDC, 2019; IOM, 2013; Milton et al., 2021). Internationally, there are
494 inconsistencies in the degree to which schools provide PA through all possible recommended
495 components/practices of a whole-of-school approach (American Alliance for Health, Physical
496 Education, Recreation and Dance, 2011; Brenner et al., 2017; Colabianchi, et al., 2015;
497 WHO, 2022). For example, in a national study of U.S. secondary schools, 7% of middle
498 school students and less than 1% of high school students reported attending schools that
499 offered all six practices conceptualized as a whole-of-school approach (having physical
500 education; offering PA breaks during the school day; having intramural sports; having
501 interscholastic sports; having active transportation opportunities to/from school; and having
502 shared-use of school facilities agreements with outside entities; (Colabianchi et al., 2015).
503 The results of a meta-analysis study indicated that increasing the number of components
504 through which school-based PA programming is provided is positively associated with an

505 increase in students' total daily PA minutes (Russ et al., 2015). However, Webster et al.
506 (2020) assert that school-based PA programming should be viewed as sufficient based on
507 whether all students achieve the goals of the program, as opposed to whether the program
508 consists of a certain number of components or practices. Future research on schools'
509 implementation of Dubai 30x30 should further investigate both the quantity and quality of
510 PA offerings and the association of such offerings with targeted student outcomes (e.g.,
511 meeting PA guidelines, meeting academic standards).

512 **Research Question 2: Students' Participation in Dubai 30x30 Activities**

513 Students reported that they mainly participated in Dubai 30x30 activities during
514 physical education and occasionally participated in activities after school and on weekends
515 but infrequently participated in activities offered during break times. Comparing these data to
516 the results for the first research question, it seems that providing opportunities for PA during
517 break times may not always lead to students participating in such opportunities. This might
518 have to do with students' motivation. Lonsdale et al. (2009) found that adolescents in Hong
519 Kong who were more self-determined in their motivation to participate in physical education
520 had higher PA levels during a free-choice period compared to students who were less self-
521 determined in their motivation. Therefore, a possible direction for future research on schools'
522 participation in Dubai 30x30 is to examine the relationship between students' motivation and
523 their participation in Dubai 30x30 activities. Additionally, the qualities or characteristics of
524 Dubai 30x30 activities that students find most appealing, and which serve as sources of
525 motivation to participate warrant increased attention in future studies. The present study
526 revealed that students were drawn to competitive activities. Other whole-of-school research
527 also highlighted competition as a key driver for students' involvement in PA opportunities,
528 although recognition of participation and effort was also important for fostering involvement
529 (Ní Chróinín et al. 2020). In another study, some adolescents' PA levels were highest when

530 non-competitive physical activities were provided as part of a comprehensive approach to
531 school health (Pirrie et al., 2022).

532 **Research Question 3: Relationship of Students' PA to School Contextual Variables**

533 During school, students were more likely to reach higher PA intensity levels when
534 they were in locations, instructional settings, and activity contexts other than the regular
535 classroom setting, core class time and academic activities. These findings reinforce the data
536 addressing the first two research questions in that the participating schools appeared to place
537 a limited focus on Dubai 30x30 as a catalyst or incubator for increasing PA during regular
538 classroom time. Providing PA opportunities during periods of the day devoted to academic
539 instruction (outside of physical education) – a practice referred to as movement integration
540 (Webster et al., 2015) – is recommended as part of a whole-of-school PA approach (CDC,
541 2019; IOM, 2013; Milton et al., 2021). The current literature on movement integration mostly
542 centers on primary/elementary school settings. In such contexts, movement integration in can
543 involve various strategies, such as infusing PA into academic lessons or giving students brief
544 breaks from sitting (Moon & Webster, 2019). Previous research shows that integrating PA
545 during regular classroom time increases children's PA participation and educational
546 outcomes (Norris et al., 2020). However, classroom teachers often report barriers to using
547 movement integration (e.g., lack of time, lack of resources, lack of support from school
548 administrators; Michael et al., 2019; Schmidt et al., 2022). It would be interesting in future
549 research to further explore the potential of using regular classroom time during Dubai 30x30
550 to increase children and adolescents' school-based PA.

551 **Research Question 4: Involvement/Engagement of Staff, Families and Community**

552 **Partners in Dubai 30x30**

553 Among school staff, physical education teachers were most involved and classroom
554 teachers were least involved in promoting Dubai 30x30, which resonates with the results for

555 the first three research questions. Whole-of-school PA recommendations commonly call upon
556 physical education teachers to serve as leaders in providing PA opportunities and galvanizing
557 the support of other school staff, parents, and community partners (Beighle et al., 2009;
558 Carson et al., 2014; McKenzie & Lounsbery, 2013). Yet, Webster et al. (2015) note that in
559 many cases, certain obstacles may need to be overcome for physical education teachers to
560 effectively lead whole-of-school PA initiatives. Such obstacles include a lack of professional
561 preparation and training specific to whole-of-school PA leadership and a lack of incentives
562 for physical education teachers to take on leadership responsibilities (e.g., personal interest,
563 tangible rewards, external accountability). The findings in the present study seem to suggest
564 that physical education teachers were successful in garnering involvement from parents and
565 engaging numerous community partners. Principals also provided support for schools'
566 participation in Dubai 30x30. Thus, a priority for future implementations of the initiative will
567 be to increase attention to helping physical education teachers build enhanced support from
568 classroom teachers.

569 **Research Question 5: Staff's Perceived Implementation Successes and Challenges**

570 Staff perceived that Dubai 30x30 brought their school communities together. This is a
571 fundamental goal of whole-of-school PA approaches, which are intended to draw upon the
572 collaboration and synergy of school staff, families, and communities (CDC, 2019; IOM,
573 2013; Milton et al., 2021). However, physical education teachers also commented on the lack
574 of guidance concerning implementation and they felt burdened by the amount of work
575 involved and pressure to make Dubai 30x30 a special month for their schools. Unfortunately,
576 we neglected to more fully explore the source of the pressure physical education teachers felt
577 in relation to implementing Dubai 30x30 activities. In previous research, factors at multiple
578 social-ecological levels exerted an influence (e.g., public policy, administrative support,
579 teacher beliefs) on whole-of-school PA practices (Cassar et al., 2022; Phelps et al., 2018). In

580 the case of Dubai 30x30, which the Dubai government initiated and strongly promotes, it is
581 possible that the pressure physical education teachers feel may stem from the government,
582 but it is also possible that other factors, such as the overall school ethos, principals' priorities,
583 parents' interest, or physical education teachers' own personal values contribute to these
584 feelings of pressure.

585 Although principals noted that time was a barrier to implementation, neither they nor
586 the classroom teachers communicated feelings of being overwhelmed, in contrast to what was
587 evidenced in the focus groups and interview with physical education teachers. A more
588 balanced diffusion of responsibility across all school stakeholders should be sought in future
589 school-based implementations of the Dubai 30x30. For instance, consistent with
590 recommendations for implementing whole-of-school PA programming (e.g., CDC, 2013),
591 schools could form a school wide Dubai 30x30 committee to promote distributed leadership,
592 shared decision-making, and clear guidance with respect to the initiative. Such a committee
593 could a designated Dubai 30x30 "champion" (e.g., a physical education teacher), classroom
594 teacher representatives, a school administrator, parent representatives, student representatives
595 and community partner representatives.

596 **Research Question 6: Perceived Impact of Schools' Implementation of Dubai 30x30**

597 Participants believed Dubai 30x30 increased PA participation and helped to promote
598 their schools. The value of these beliefs in energizing school staff and sustaining their
599 involvement in the initiative is an important area of focus for future research. A study of
600 school principals in the U.S. found that participants' outcome expectations directly predicted
601 their level of self-reported involvement in CSPAPs (Orendorff et al., 2020). Specifically,
602 principals were more likely to be involved if they believed a CSPAP would benefit students
603 not just in terms of their PA participation but also in terms of their physical development,
604 cognitive development, social development, school attendance and academic performance.

605 Participants in the present study made little reference to most of these outcomes when
606 discussing the impact of Dubai 30x30. In the future, researchers should more systematically
607 measure a broad range of student outcomes associated with schools' participation in Dubai
608 30x30, as such data may spur staff's involvement.

609 **Limitations**

610 This study had several limitations. First, although working with only a few schools
611 allowed us to explore school-based Dubai 30x30 implementation from multiple perspectives,
612 the use of a small convenience sample limits the generalizability of the results. Second, we
613 sought to survey parents in this study, but no parents participated. Understanding the
614 perspectives of parents and community partners is critical to advancing research and practice
615 related to schools' implementation of Dubai 30x30. Third, this study merely provides a
616 snapshot of schools' participation in the initiative. Future studies should employ multi-year
617 data collection protocols to examine participation patterns and investigate factors that may be
618 associated with variation in implementation rates and strategies. Furthermore, studies
619 adopting experimental designs will be useful in determining cause-effect relationships
620 between implementation practices and outcomes.

621 **Conclusions**

622 This study provides an initial glimpse into schools' implementation of Dubai 30x30
623 from a whole-of-school PA perspective. In line with recommended practices (CDC, 2019;
624 IOM, 2013; Milton et al., 2021), physical education served as a central component in the
625 promotion of PA within the participating schools and physical education teachers played
626 leading roles in organizing and implementing Dubai 30x30 activities. While implementation
627 resulted in several positive outcomes, physical education teachers bore the brunt of
628 responsibility for schools' participation in the initiative and a gap in PA promotion was
629 evident during regular classroom time. Further research is needed to determine whether these

WHOLE-OF-SCHOOL PHYSICAL ACTIVITY

630 results generalize to other schools in Dubai, and if so, how to optimally support
631 collaborations between physical education teachers and other school stakeholders to harness
632 Dubai 30x30 for whole-of-school PA.

633 **Acknowledgements**

634 The authors wish to acknowledge the support of the principals, teachers and students
635 who agreed to participate in this study.

636 **Conflict of Interest**

637 The authors declare that the research was conducted in the absence of any commercial
638 or financial relationships that could be construed as a potential conflict of interest.

639 **Author Contributions**

640 CM and CAW conceived and designed the study. CAW, CEH, GT, ZMI, SZFN, MG,
641 SK, MK, TK, PP and YS collected data for the study. CM and CAW organized the database.
642 RGW performed the quantitative data analysis. CM and CAW performed the qualitative
643 analysis. CM, CAW and RGW wrote the first draft of the manuscript. All authors contributed
644 to manuscript revision, read, and approved the submitted version.
