16 **Abstract**

17 **Introduction:** An innovative and community-based intervention is implemented in the Guiana Shield
18 to eliminate malaria among people involved in artisanal and small-scale gold mining. The intervention
19 is possible in the field thanks to community health workers (CHWs) who are previously trained to
20 master all intervention's procedures, including training gold miners to treat themselves for malaria.
21 This article describes thus a training-of-trainers (ToT) program for CHWs, as well as the method and
22 results of its evaluation in terms of quality and effectiveness. **Methods:** A mixed-method case study
23 was implemented in two steps and based on knowledge survey, satisfaction test, observations and semi-
24 structured interviews. Quantitative and qualitative data were triangulated. **Results:** The project team's
25 previous experience and the Guiana Shield countries' commitment to the WHO E-2025 initiative were
26 identified as levers for the quality of the ToT training, while the complexity of the project context was
27 a challenge. Group dynamics and adaptations were found to be central elements of a high-quality
28 training program. CHWs' satisfaction was elevated especially regarding training format and learning
29 results. Improvements on knowledge level demonstrated good effectiveness of the training.
30 Nevertheless, some difficulties persisted regarding certain tasks to be carried out by CHWs during the
31 intervention procedure. Further on-the-job training permitted to address them, improving CHWs'
32 practices in the field. **Discussion:** High-quality, effective, and appropriate training programs are
33 required for effective and sustainable intervention involving CHWs profiles. Training design is a
34 crucial point to attend quality and effectiveness. ToT model has been shown to allow a high level of
35 satisfaction, good learning results and satisfactory implementation in the field. Initial and continuing

36 training is an indispensable continuum to sustain good practices in the field and CHWs' motivation.
37 Training evaluation permits to standardize methods and facilitate transferability of successful efforts.

38

39 **1 Introduction**

40 Although since 2000 the malaria burden considerably decreased in the Americas, it is still endemic in
41 the Guiana Shield (1–3). In this area, the major malaria reservoir is represented by a mobile, and hard-
42 to-reach population challenging the fight against malaria (4,5). This population is mainly represented
43 by Brazilians (95-98%) involved in artisanal and small-scale gold mining (ASGM) in the Amazonian
44 rainforest, where they live in a situation of vulnerability with reduced access to the health care system
45 (6,7).

46 Despite the complexity of reaching populations suffering from social inequality, strategies have been
47 developed to provide health care access (8). Indeed, at a global scale community-based interventions
48 play a fundamental role in improving population health, and increasing access to health care and
49 services (9,10). Worldwide, a range of effective interventions involving community health workers
50 (CHWs) exists, especially with the aim of fighting malaria (11,12). In malaria elimination programs,
51 CHWs are often involved in case management, malaria surveillance, diagnosis, treatment, prevention
52 and health promotion activities (13).

53 A complex, innovative and community-based intervention has been implemented in 2018-2020 as a
54 result of a scientific partnership established between Brazil, French Guiana and Suriname focusing on
55 populations involved in ASGM in the Guiana Shield in situations of extreme isolation from health
56 services (14). The aim was the evaluation of a strategy that consisted in providing access to diagnosis
57 and treatment through the distribution of kits (called “malakits”), associated with a training to use it
58 correctly (15). The malakit was composed of self-testing kits with rapid diagnostic tests (RDTs) and
59 self-treatment kits in case of malaria This strategy was evaluated as effective and acceptable by the
60 community, and has been scaled up in Suriname (16–18).

61 Started in 2023, another intervention's evaluation study – Curema – expands the foundations of the
62 Malakit project to also include the radical cure of *Plasmodium vivax* (19,20) . Curema intervention
63 consists of two modules offered at inclusion sites located in Brazil and Suriname, in resting and
64 logistical places across the border in French Guiana, regularly frequented by people involved in ASGM
65 in French Guiana: the “malakit” module and the “radical cure” module. The latter aims to prevent
66 relapses and thus reduce the number of human hosts capable of transmitting the parasite; asymptomatic
67 individuals at risk of carrying *P. vivax* hypnozoites are offered presumptive treatment with chloroquine
68 and aminoquinolines.

69 The intervention is made possible by CHWs, specifically recruited for the Curema project, and working
70 in pairs on the field at the inclusion sites. As part of the Curema project, CHWs are responsible for
71 enrolling participants and providing health education to participants followed by individual training
72 during the inclusion process (**Figure 1**). Furthermore, they carry out collective outreach activities on
73 malaria in the community.

74 Before the launch of the project, the CHWs participated in a training program which enabled them to
75 take part in a bidirectional working space, to master health research procedures, to present information
76 effectively, to lead activities that reinforce participants' learning, and to collaborate on the design of

77 working tools. Moreover, they were supported during the gradual launch of the project in the field and
78 regularly supervised during the whole project implementation.

79 Despite the large integration of CHWs in public health interventions, little is known about best
80 practices for training them. To ensure effective CHWs activities, it seems vital to provide a good
81 training and a continuous professional development through supervisions. Nevertheless, literature is
82 often lacking evidence on the implementation and evaluation of training programs. A number of
83 theoretical frameworks have been developed for evaluating this process, but the introduction of
84 standardized evaluation methods in the context of training evaluations is increasingly necessary (21–
85 24).

86 Therefore, it seems crucial to share findings and experiences in this domain with the scientific
87 community, in order to facilitate the transferability of successful efforts.

88 This present article aims to illustrate the results of an evaluation of the quality and effectiveness of the
89 training program offered to CHWs involved in the Curema project.

90 **2 Materials and methods**

91 **2.1 Description of the Curema training program**

92 **2.1.1 CHWs' recruitment**

93 The recruitment process was conducted separately by local partners for Brazilian and Surinamese
94 inclusion sites with the support of the project's promotor, the Hospital of Cayenne, French Guiana.
95 Their profile is similar to CHWs involved in malaria intervention in other countries (25,26). CHWs'
96 recruitment criteria were: being over 18 years of age, belonging to the community involved in ASGM
97 or knowing it closely, speaking fluent Portuguese, being able to use information technology tools
98 (tablets, smartphones, etc.), living in or being prepared to move to one of the project locations for
99 inclusion sites. Moreover, a technical diploma as nurse-assistant was an asset for CHWs assigned to
100 Brazil.

101 The CHWs working at the Brazilian inclusion sites were employed by the NGO DPAC-Fronteira
102 (*Desenvolvimento, Prevencao, Acompanhamento e Cooperacao de Fronteiras*; Development,
103 Prevention, Support and Cooperation on Borders) and were only involved in activities linked to the
104 Curema project. DPAC-Fronteira selected CHWs before they underwent the training program. At the
105 Surinamese inclusion sites, the CHWs were employed by the Surinamese research foundation SWOS
106 for the Curema project (half-time) and by the Surinamese National Malaria Elimination Programme
107 (NMEP) for the second half-time as “malaria service deliverer” (MSD). This MSD role included in
108 malaria case management (diagnosis, treatment, notification, and investigation) as well as in
109 distributing mosquito nets, in remote areas related to ASGM (27). CHWs for Suriname inclusions sites
110 underwent a two-steps recruitment process, consequently a larger number of potential CHWs was
111 invited to attend the training program. Most CHWs invited to attend the Curema training program,
112 already functioned as MSD in the mining fields. It was made clear to all trainees, that participating in
113 the training was no guarantee for being selected to work in the Curema project. Final CHWs were
114 selected after the end of the initial training, just before the launch of the project in the field.

115 Prior to the Curema training program, CHWs undertook basic training sessions separately as a pre-
116 work. In Brazil, a basic one-day training on malaria was provided by Fiocruz and a training on NGO

117 work and community mediation was provided by DPAC. In Suriname, CHWs received initial and
118 refresher training on malaria prevention, diagnosis, and treatment techniques by NMEP.

119 **2.1.2 Design and development of the training program**

120 With the aim of making CHWs able to master all the procedures and tasks they need to carry out, the
121 Curema training program was designed using a training-of-trainers (ToT) model with two components:
122 an initial training and an on-the-job training (**Figure 2**).

123 Adult learning principles were applied to design the training program focusing on practice-based
124 activities to be appropriate for CHWs' needs and to give them the opportunity to practice (28). To be
125 more effective, and to reach all of the audience, varied activities and methods were implemented
126 mobilizing cognitive, affective, psychomotor learning principles, and the visual, auditory and
127 kinesthetic (VAK) learning model (29–31). Moreover, the training program was tailored and centered
128 on CHWs. Therefore, the training program was conducted in Portuguese using learning tools targeting
129 on an audience with a low level of scholarship.

130 All partners and organizations involved in the Curema project participated in the training program,
131 increasing contributions from all staff and from professionals with different experiences and expertise.
132 Trainers used a horizontal approach to make CHWs feel respected and to make the learning
133 environment safe and supportive. To be more responsive to the needs of the CHWs and the community
134 in the field, a bidirectional approach was used, and CHWs were asked to collaborate in the design of
135 operating tools.

136 The initial training component took place in Paramaribo, Suriname, jointly by the entire team of CHWs
137 both from Suriname and Brazil. Considering the type and number of topics to be addressed, the initial
138 training was developed for three-weeks to allow enough time to ensure an effective knowledge transfer,
139 an exhaustive practice of skills and new procedures, an appropriate adaptation of tools, and a good
140 team and capacity building.

141 The on-the-job training component took place at each inclusion site and lasted two to three days. Its
142 aim was to support CHWs while the project was gradually rolled out in the field and the first inclusions
143 carried out.

144 The components included on the ToT program, as Centers for Disease Control and Prevention
145 recommend, are shown in **Table 1** (32).

146 **2.2 Evaluation of the quality and effectiveness of the training program**

147 **2.2.1 Framework**

148 Evaluation was carried out for the quality and effectiveness of training.

149 Quality was defined by the International Standard Vocabulary as “all the characteristics of an entity
150 that influence its ability to satisfy expressed and implicit needs” (33). In this context, authors referred
151 to “needs” as the outcomes to be achieved by CHWs through the training program.

152 Effectiveness corresponded to the extent to which the training outcomes are achieved. According to
153 Kirkpatrick's theoretical framework, effectiveness is assessed at 4 levels: reaction, learning, behavior,
154 and system (34).

155 The elements to be evaluated were defined as follow (24):

- 156 • Quality assessment
 - 157 ○ Context: external factors which can influence the training program, both as obstacles
 - 158 and levers and which cannot be controlled by the training deliverers.
 - 159 ○ Input: internal conditions under which the training program takes place (eg. methods
 - 160 used by trainers, CHWs' prior knowledge, group dynamism, etc.).
 - 161 ○ Process: the training delivery process, including the adaptation, dose delivered, CHWs
 - 162 reached.
- 163 • Effectiveness assessment
 - 164 ○ Reaction: level of CHWs' satisfaction in terms of dose and content.
 - 165 ○ Learning: changes in level of knowledge, know-how and interpersonal skills.
 - 166 ○ Behavior: level of concordance of CHWs' practice with the reference (Curema
 - 167 protocol)
 - 168 ○ System: impact of CHWs' practice on community health education

169 **2.2.2 Methods**

170 The design of the training evaluation consisted of a mixed-method case study, executed in two steps
171 as shown in **Figure 2**. Firstly, during the initial training in Paramaribo developed in a classroom
172 environment, and secondly during the on-the-job training during the launch of the intervention on
173 inclusion sites. First step is nurture by quantitative and qualitative methods, while second step
174 correspond to qualitative method. The quantitative component provided computable data on
175 satisfaction, knowledge improvement and practice, while the qualitative component enabled giving
176 context and an in-depth explanation of the quantitative results.

177 Data were collected through knowledge surveys, a satisfaction test, observations, and semi-structured
178 interviews, and analyzed as follows (**Table 2**):

179 The analysis was conducted using a theoretical framework conceptualized for the evaluation of training
180 programs for the control of infectious diseases in cross-border contexts, by the Centre for Infectious
181 Disease Control, National Institute for Public Health of Health of The Netherlands and The EU Healthy
182 Gateways Joint Action (24).

183 **2.2.3 Ethics**

184 Curema protocol was approved by the ethics committees of the countries involved in the project
185 (Brazil: CONEP:5,507,241 and Suriname: CMWO05/22). The evaluation of quality and effectiveness
186 of CHWs' training program is part of the secondary objectives of the Curema protocol.

187 According to the article R1121-1 of the French Public Health Code, the regulatory classification of this
188 evaluation is a “research not involving the human being” (outside the scope of the *Loi Jardé* or *RNIPH*)
189 because it “aims to evaluate the methods of practice of healthcare health professionals or teaching
190 practices in the field of health”(35). A collective oral information was reached out and participants'
191 non-opposition was collected. For semi-structured interviews, consent was requested.

192 The evaluation was conducted in accordance with the principles of the Declaration of Helsinki. Data
193 collected were recorded in accordance with French law and the European Union General Data
194 Protection Regulation. Data collected, field notes and transcribed recordings were anonymized and
195 stored on a secure server.

196 **3 Results**

197 The initial training took place between February the 13th 2023 and March the 03rd 2023. On-the-job
198 training started with the launch of the intervention at the first inclusion site on March the 13th 2023 and
199 lasted two to three days per site. The evaluation was carried out between February the 13th 2023 and
200 April the 03rd 2023.

201 **3.1 CHWs profile**

202 A total of 20 CHWs were invited for the training program, 14 from Suriname employer-organizations
203 and 6 from Brazil employer-organization. The characteristics of the trainees are summarized in **Table**
204 **3**. The majority were women over 40, with Portuguese as their mother tongue. Five CHWs had Spanish
205 as their mother tongue, but could proficiently speak and understand Portuguese. Less than a quarter
206 had previously worked in research. CHWs profiles were different in Brazil and in Suriname because
207 of different recruitment criteria. Of the 20 CHWs, 4 took part in individual semi-structured interviews
208 during Evaluation Step 2.

209 **3.2 Results of the quality evaluation**

210 **3.2.1 Contextual levers and difficulties**

211 Two elements were identified as levers for the training. The first is the political, economic and
212 intellectual environment in which the Curema project – and consequently the training program –
213 navigates. In fact, Suriname and French Guiana have committed to eliminate malaria from their
214 territories by 2025 (World Health Organization's E-2025 initiative) and Brazil by 2035 (1,36,37). There
215 is no doubt that this commitment ensured good conditions for the start of Curema intervention and its
216 training program. Second, previous lessons learned during Malakit project by our team in training the
217 same community in a similar context and partners experiences were precious to guide the design and
218 development of the ToT program, particularly regarding the methodology, the time, the appropriate
219 tools for the audience (38).

220 On the other hand, the complexity of Curema project also influenced the training because of a large
221 number of interacting components that are sometimes difficult to align in order to make possible the
222 training program development (39). In fact, Curema is an international project which means several
223 organizational levels, country-specific features for implementation on the field, communication in
224 different foreign languages depending on the actors, logistical issues linked to differences in
225 bureaucracy and regulatory requirements between countries (40). Moreover, it was important to
226 consider that the number and level of articulations of the activities required by CHWs complexified
227 the training program design. Finally, differences on recruitment and employment frameworks made
228 CHWs group composition heterogeneous: previous baselines knowledge were dissimilar due to
229 previous experiences and to a pre-work organized separately for Brazil and Suriname.

230 **3.2.2 The importance of group dynamics**

231 Among the CHWs who attended the training program, 4 (20.0%) had already worked in the research
232 field and 10 (50%) had already collaborated with one of the three employer-organizations involved in
233 the Curema project. We observed that, for these CHWs, prior knowledge of certain procedures
234 increased mastery of the subject and reduced the time needed to learn. In addition, thanks to a
235 participatory approach to training and the inclusion of practical sessions of pair and group work in the
236 schedule, peer education dynamics took place. The attention in the choice of the classroom and the
237 setting is also decisive in the generation of these dynamics. Thus, these CHWs became a resource for

238 supporting training. However, certain disadvantages were also identified such as the transfer of some
239 erroneous automatisms already adopted in their practice. Feedback activities allowed to readjust
240 practices.

241 The observed interpersonal relationships among CHWs had a strong influence on group dynamics for
242 learning, active participation in training and engagement in the project. Because of the different
243 recruitment framework, at the beginning of the training program CHWs appeared to form two distinct
244 groups. Based on team building and adult-learning principles, more collaborative activities were
245 implemented in order to facilitate exchanges and integration. Some spontaneous team-building
246 initiatives were also pointed out.

247 *“Afterwards, the group work was done, which [...] allowed people to feel more in tune with each other*
248 *and communication improved [...] which was fun and at the same time a joint learning process, it was*
249 *very good.” (Interview verbatim, CHW from Suriname)*

250 **3.2.3 A flexible and evolutive process**

251 The training was delivered in 105 hours over a period of three consecutive weeks (**Table 1**). The
252 training program was designed to be part of a continuous professional development approach centered
253 on CHWs. Thus, it was flexible and evolutive. Numerous adaptations were made to ensure constant
254 improvement of CHW knowledge and practice and to perfect training (schedule, activities, tools) and
255 project elements. Indeed, many of those elements had already been co-designed through community
256 involvement. The bidirectional working space during the training sessions enabled to adapt vocabulary
257 and content of the inclusion questionnaire, to add supplementary material in the facilitation manual, to
258 make a video for the informed consent procedure. As they reported during informal conversations and
259 semi-structured interviews, CHWs greatly appreciated the opportunity to be part of this evolution
260 process.

261 **3.3 Results of the effectiveness evaluation**

262 **3.3.1 Reaction: participant’s satisfaction**

263 Overall, CHWs affirmed to be very satisfied with the training. The methodology used for the training
264 was particularly appreciated by CHWs with reference to activities using kinesthetic learning model,
265 practice-based activities, group-work and bidirectional approach. All items (**Table 2**) explored on the
266 scale of 1-5 ranging from "not at all satisfied" to "completely satisfied", were ranked over 4.
267 Satisfaction is shown to be directly linked to learning:

268 *“It was fun, creative, and useful for memorizing, because you remember [what you learn using these*
269 *techniques], isn't it? We don't forget. The games were very good” (Interview verbatim, CHW from*
270 *Suriname).*

271 Indeed, the 61.1% of the 18 CHWs answering the satisfaction test declared had reached "optimum
272 mastery", the 27.8% reported "sufficient mastery but needed support during the launch in the field";
273 and only one person felt "insufficient mastery" asking for "more time for training".

274 CHWs were observed to be satisfied also during on-the-job training. In fact, some of them stated
275 trainees indicated that the sessions provided the knowledge and practice needed to start the job in the
276 field.

277 **3.3.2 Learning: evaluation of knowledge improvement**

278 The evaluation found a knowledge improvement with a significant increase in the average scores of
279 the test between pre and post survey with a $p < 0.05$ both for test scores at $t_0 - t_1$ and $t_0 - t_2$ (**Figure 3**). On
280 the contrary, differences in scores between tests at t_1 vs t_2 were not significant ($p = 0.26$). The same
281 trend was shown for analyzing individual scores' increase for CHWs which underwent the knowledge
282 survey at t_0 , t_1 , and t_2 . The bivariate analysis for age, sex, recruitment country, mother tongue and
283 previous collaboration did not show any differences in these categories, apart from a better basic
284 knowledge in the t_2 test among those with previous experience in research field ($p < 0.05$).

285 Systematic inclusion process monitoring through the checklist pointed out that two-thirds of observed
286 inclusion simulations ($n = 16$) contained inaccuracies in the step-by-step process. Nevertheless,
287 inaccuracies often concerned the same steps. The highest rate of inaccuracy was found for the
288 explanation of the patient information note for informed consent procedure that was inaccurate in
289 29.2% of the observed inclusion simulations, followed by the process of installing the Curema
290 smartphone application, which had an inaccuracy rate of 16.7%. These results are in line with the
291 results of the qualitative analyses based on informal conversations and interviews with CHWs who
292 also reported reasons why those two steps were difficult in their opinions. First, the information note,
293 using scientific terms and constructions, was dense of complex concepts and difficult to be understand
294 for people with poor level of scholarship.

295 *“What really frightened us, I can say for myself and for several other people, was the informative note*
296 *[...] What really complicates things for me is the informative note.” (Interview verbatim, CHW from*
297 *Suriname)*

298 Second, the Curema smartphone application was not enough explored during the training program.
299 Indeed, at that time, some technical developments of the application were in progress. Thus, the final
300 version and procedure to use it were not integrally exposed.

301 **3.3.3 Behavior: from the training to the field**

302 During the observed launch at the inclusion sites, the level of concordance of CHWs' practices with
303 the Curema standard procedures was adequate even if, during on-the-job training, further support by
304 trainers was needed to guide CHWs towards autonomy. Moreover, CHWs expressed the need for more
305 time and fieldwork to master the step-by-step process and re-elaborate concepts for an effective
306 knowledge transfer to the community.

307 Constructive professional relationships, good team working, and a sense of belonging to a common
308 cause were also pointed out by CHWs as factors able to influence behavior in the field, leading to
309 engagement and proactive participation in the intervention.

310 *“If you don't feel good in the team, this can have an influence on your motivation, for example, in the*
311 *way the work is run.” (Interview verbatim, CHW from Suriname)*

312 **4 Discussion**

313 High-quality, effective, and appropriate training are required for effective and sustainable intervention
314 involving CHWs profiles. This involves a great deal of effort in development, implementation, and
315 evaluation. Moreover, this study highlights the importance of quality to achieve effectiveness of a
316 training program. ToT model has been shown to allow a high level of satisfaction, good learning results
317 and satisfactory implementation in the field.

318 **4.1 Limits of our study**

319 The evaluation was carried out by researchers previously involved in the design, development, and
320 implementation of the training. Despite this could lead to attribution bias, several data sources – both
321 quantitative and qualitative – were used for the evaluation, enabling data triangulation and increasing
322 internal validity.

323 The Kirkpatrick’s theoretical framework used recommends to assess effectiveness at 4 levels: reaction,
324 learning, behavior, and system. The higher the impact in terms of effectiveness, the better the achieved
325 the final training outcome (24). Nevertheless, the assessment at the system level is more challenging
326 and we were unable to evaluate it. A further evaluation of learning transfer to the community at the
327 end of the intervention could be realized by the post-intervention cross-sectional survey and would be
328 very useful.

329 **4.2 Training design: a crucial step**

330 Developing a high-quality training program demands careful considerations of the learning methods
331 and modules to be designed. We designed the training program on a ToT model based on adult-learning
332 principles. Consequently, the training program contained ample interactive sessions including group
333 discussions, role plays, practical activities, and simulations. This methodology is considered more
334 effective in comparison to traditional teaching approaches, especially among CHWs with poor level of
335 scholarship (9,41). Despite complexities, we can affirm that the quality of the training was good and met
336 the needs for the implementation of the Curema intervention in the field. The significant increase in
337 pre-post scores obtained at the knowledge survey suggests the achievement of theoretical concepts.
338 Moreover, the ample panel of activities helped increase the satisfaction level, in accordance with the
339 literature (24).

340 A crucial point to be discussed is adaptations. During the training program, several adaptations were
341 necessary to be adopted both for training program and for the intervention on the field. We could even
342 say that one of the aims of the training was to enable these adaptations to be made, thanks to the
343 bidirectional space set up with the CHWs. Despite the balance between adaptation and fidelity in
344 implementation science is still a topic of debate (42–44), several examples in literature described
345 helpful adaptations: Miller et al. adapted terminology of their intervention to reduce the possibility of
346 misinterpretation of their study population, while Holtrop et al. shown training program or recruitment
347 adaptations due to outside forces or made to improve feasibility or engagement (45,46). A review by
348 Stirman et al. identified most common reasons intervention adaptation were to address language,
349 cultural differences, literacy, or situational constraints (47). In our experience, we can argue that
350 adaptive aptitude, embedded in a community-based approach, may have enabled our intervention to be
351 more appropriate, effective, and sustainable by fostering the bidirectional transfer of knowledge, the
352 empowerment of CHWs as a central actor of the intervention, and their engagement in the Curema
353 project.

354 To be appropriate, trainings of the CHWs should take place in their work environment to practice in a
355 real-life situation (48,49). Our quantitative and qualitative results suggested that, although many
356 simulations were carried out during the initial training, real practice in the field during on-the-job
357 training permitted CHWs to improve mastery of procedures and to appropriately perform participants’
358 inclusions and education activities regarding malaria. Similar results have been shown in previous
359 experiences among the same community and intervention patterns by Galindo et al. who concluded
360 that practical training in the field was the most appropriate learning method for CHWs (38). Besides,
361 a scoping review describing training, supervision and quality of care in community-based programs in

362 different contexts from the studied one, also concluded that training in the field and on-site have been
363 shown to improve CHWs' practices (50).

364 Another important element to address is team-building, which has been found out as a crucial element
365 for learning process and daily work on the field. During the training, the team-building activities helped
366 to motivate CHWS and encouraged peer learning. Moreover, the sense of unity jointly with the
367 engagement towards the goal of eliminating malaria increased CHW's motivation in the daily working
368 context, particularly in regions where malaria is in the process of being eliminated. Similar results
369 showing how relationships with other cadres and actors could play a major role on sustain motivation
370 are reported in literature (51,52).

371 **4.3 Evaluation**

372 Nowadays, limited number of studies exists regarding quality and effectiveness evaluation of training
373 programs, especially those regarding infectious diseases in cross-border areas and those addressed to
374 CHWs. Indeed, a recent review of the literature analyzed 62 articles on the evaluation of ToT, and
375 found only 5 in the field of infectious diseases and in cross-border contexts, with heterogeneous and
376 non-standardized methodologies (24). Reviewing articles on CHWs-based programs for cardiovascular
377 disease management in low-income and middle-income countries with the aim of evaluate training
378 program effectiveness, Abdel-All and al. found only 8 articles reporting training details on evaluation,
379 among 90 eligible for their systematic review (53).

380 Scientists call for studies examining the effectiveness and characteristics of training programs for
381 CHWs to provide reliable evidence, to avoid replication of programming difficult, to ensure high-
382 quality of training programs, to make possible standardization on the evaluation (53–57). This study
383 shows as developing methodology for training evaluation is possible, feasible and necessary to ensure
384 advancements on this field. Evaluation of training programs must be integrated in all CHWs-based
385 health intervention.

386 **4.4 Initial and continuing training: an indispensable continuum**

387 ToT is a good predictor of the long-term sustainability of public health initiatives (23). This ToT
388 program was the starting point of a continuous professional development scheme; indeed we
389 considered continuing re-training as important as initial training. In fact, despite a widespread lack of
390 ongoing training or other forms of continuing professional development, several studies have found
391 the positive association between training and maintaining good standards of practices. (58–61). This is
392 shown to be linked: (i) to refresh of acquired skills and knowledge and (ii) to motivation. For instance,
393 Curtale et al. suggest that even few days additional training/supervision, if regularly provided, results
394 in improved quality of service (62). Furthermore, access to training and supervision seems to be
395 associated with non-monetary incentive sustaining CHWs motivation and engagement (13,61).
396 Moreover, a continuing training centered on CHWs seems to be an asset to the strategy of continuous
397 professional development. Puchalski Ritchie et al. in their training course, established training contents
398 on needs they identified through a prior qualitative survey performed by CHWs (63). These
399 recommendations sustain the design we adopted.

400 Ongoing training, including various moments of evaluation and reflection, enable interventions to be
401 adjusted in time to ensure proper implementation. Constant efforts throughout the project are essential
402 to maintain quality while adapting to the inevitable changes in the context in which the intervention
403 evolves.

404

405 **5 Figure legends**

406 **Figure 1:** CHWs tasks over Curema enrolling process and knowledge/skills associated with.

407 **Figure 2:** Timeline and flowchart of the training design and training evaluation over Curema
408 intervention phases.

409 **Figure 3:** Evolution over time in the knowledge survey score for basic knowledge (at t_0 , t_1 , and t_2)
410 among all CHWs (A), for advanced knowledge (at t_1 , and t_2) among all CHWs (B), for basic knowledge
411 (at t_0 , t_1 , and t_2) per CHWs (C), for advanced knowledge (at t_1 , and t_2) per CHWs (D).

413 **Table 1:** The ToT components included on the Curema training program.

ToT component	Pre-assessment	Pre-work	Training agenda	Facilitation manual	Modelling of skills and tasks
Aim	Identifying pre-training knowledge and skills of the CHW, to determine training needs	Providing CHWs with the knowledge and background needed before the training program	Providing some degree of control over what, when and how CHWs will learn during the training program.	Organizing tools and improving the capacity of CHWs to transfer knowledge	Enabling CHWs to form a clear idea of how to carry out a task by showing them how to perform a skill while describing each step
Initial Training	Pre-training knowledge survey	<p>Topics: basic knowledge about malaria (diagnosis and treatment), epidemiology in the Guiana Shield and malaria control strategies</p> <p>Pre-work training sessions took place separately for the CHWs working on the inclusion sites located in Brazil or Suriname, due to different recruitment frameworks. Those sessions were provided respectively by two different organizations, due to legitimacy of respective countries</p>	Provided on the first day of the training	<p>Audio-visual tools (i.e. a step-by-step tutorial about how to perform a Malakit RDT) were uploaded to tablets</p> <p>Visual sheets for explanation support were put together in a CHW binder</p> <p>Games and teach-back cards were also provided as teaching tools</p>	<p>Following training units:</p> <p>Audio-visual tutorial for Malakit RDT and for G6PD test;</p> <p>Information Education and Communication (IEC) strategies and tools use;</p> <p>Inclusion process simulation role-play;</p> <p>Informative note and informed consent procedure role-play</p>
On-the-job training	<p>Post-initial-training knowledge survey</p> <p>Feedback of the trainers regarding the initial training program outcomes</p>	Initial training	Not applicable	The same tools and CHW binder with the addition of some updated sheets	Not applicable

ToT component	Adults learning principles	Skill practice	Feedback	Action planning	Planned follow-up support
Aim	Diversifying activities based on VAK Model and Bloom's Taxonomy, enhancing experience, designing a problem-centered training program to reach CHWs and make the training effective	Providing the opportunity for the practice of selected training activities or contents.	Collecting CHWs' feedback regarding the learning process to be adjusted.	Taking CHWs through the process of creating or adjusting tools and practices for the intervention to succeed.	Strengthening the knowledge and skills of CHWs, so they can be applied effectively.
Initial Training	Implementation of games, practical simulations, video making, and a variety of activities with movements needed Activities in small working groups composed of heterogeneous profiles for skills and personalities	Practice of: data collection, tablet use, G6PD test execution, Malakit RDT execution monitoring, participants and community training, health education, public speaking, inclusion process simulations, installation of Curema application for smartphone	Daily debriefing at the beginning of the day regarding previous content, doubts, difficulties. Use of a checklist to help on completing the whole inclusion process Satisfaction assessment and discussion group on the last day	Information Note video - for the signature of the ICF (Informed Consent Form) Feedback about Questionnaire	Continuous professional development through on-going training for the intervention launch on the inclusion sites.
On-the-job training	Directly linked to on-site work and problem-solving	Inclusion process, community outreach activities	Debriefing together at the end of inclusion process (either real process or simulations)	CHWs' initiatives encouraged (group of discussions, projection of promotional videos, marauding and outreach activities, etc)	Continuous professional development and targeted follow-up: (i) regular supervision visits (ii) remote support via a specific WhatsApp group

416 **Table 2:** Methodology used to evaluate quality and effectiveness of the Curema training program.

Evaluation method	Collection Tool	Inclusion criteria	Temporal aspects	Analysis	Software
Knowledge survey	Basic and advanced multiple choice and true-false questions	All CHWs attending the training program who agreed to undergo the knowledge survey (N=18 at t ₀ ; N=16 at t ₁ ; N=15 at t ₂)	Evaluation step 1: Pre-training (t ₀), immediate post-training (t ₁) and 1-month follow-up (t ₂) questionnaires	Mann–Whitney–Wilcoxon U test to compare average scores; Wilcoxon signed ranks test to compare average scores only for CHWs answered the three tests; Bivariate analyse of the following variables: age, gender, recruitment country, mother tongue, previous collaboration, retained after training	Microsoft® Excel® for Microsoft 365 MSO (Version 2304 Build 16.0.16327.20200) Stata® (Version 14.2 Copyright 1985-2015 StataCorp LLC).
Observation (direct and indirect)	Observation guide to collect: Informal conversations with participants and trainers; Participant observation; Systematic inclusion process monitoring through a check-list; Documentary research; Discussion groups	Evaluation step 1: All CHWs attending the initial training who agreed to participate in the observation (N=20) Evaluation step 2: Convenience sampling depending on the inclusion site to be launched. CHWs assigned to the predetermined inclusion site who agreed to participate in the observation (N=4)	Evaluation step 1: During the initial training Evaluation step 2: During on-the-job training	Inductive content analysis; Descriptive analysis for quantitative data	ATLAS.ti® (Version 23.1.2.0, licence L-685-998). Microsoft® Excel® for Microsoft 365 MSO (Version 2304 Build 16.0.16327.20200)
Satisfaction Test	Single-choice and 5-point-Likert-scale test (anonymous test) to explore opinion on methodology, relevance, clarity, trainers support, practice, facilitation manual, group dynamics and logistic	All CHWs attending the initial training who accepted to fill in the satisfaction test (N=18)	Evaluation step 1: At the end of the initial training	Descriptive analysis	Mentimeter® (Version 3.2.7, 26-08-2021)
Semi-structured interviews	CHWs interviews: an interview guide was developed based on preliminary results of the observations	Evaluation step 2: Convenience sampling depending on the inclusion site to be launched. CHWs assigned to the predetermined inclusion site who agreed to be interviewed (N=4)	Evaluation step 2: During on-the-job training (4h 38' 18")	Description analysis on the verbatim (Brazilian Portuguese) mainly deductive with inductive elements	ATLAS.ti® (Version 23.1.2.0, licence L-685-998).

418 **Table 3:** Characteristics of CHWs who attended initial training program in Paramaribo and who
419 participated to semi-structured interviews

CHWs characteristics	Involved in the initial training in Paramaribo (N=20)		Involved in semi-structured interviews (N=4)		
	Percentage (%)	Number (n)	Percentage (%)	Number (n)	
Sex					
	Male	20.0	4	25.0	1
Age (years)					
	18-40	20.0	4	25.0	1
	>40	80.0	16	75.0	3
Country of the employer-organization					
	Brazil	30.0	6	0.0	0
	Suriname	70.0	14	100.0	4
Mother tongue					
	Portuguese	75.0	15	100.0	4
	Spanish	25.0	5	0.0	0
Previous collaboration with the employer-organization					
	Yes	50.0	10	100.0	4
Previous work experience in research					
	Yes	20.0	4	0.0	0
Belonging to ASCM- related community					
	Yes	70.0	14	100.0	4
Retained after training					
	Yes	75.0	15	100.0	4

421 7 Conflict of Interest

422 The authors declare that the research was conducted in the absence of any commercial or financial
423 relationships that could be construed as a potential conflict of interest.

424 8 Author Contributions

425 CC, JMI, GM, MD and AS participated in the conceptualization. CC and JMI developed the
426 methodology. CC made formal analysis and drafted the manuscript. JMI, MD and AS reviewed
427 initial draft. All the authors read, corrected, and approved the final manuscript.

428 9 Funding

429 Curema project is funded by European Funds FEDER-PCIA and Synergy no 8754, and by Regional
430 Health Agency of French Guiana.

431 10 Acknowledgments

432 Authors would like to thank all CHWs who participated to the training and the evaluation, and who are
433 currently make possible the implementation of Curema intervention in the field. Moreover, authors
434 thank Surinamese MoH and particularly the NMEP for their support to CHWs' training program in
435 Paramaribo.
