24 Abstract

25 **Objective:** The objective of this scoping review is to identify and analyze the literature on
26 parenting self-efficacy in the non-birthing parent within the first year postpartum.

27 **Introduction:** Parenting self-efficacy is a parent's confidence in their ability to organize and
28 execute a set of tasks related raising children and providing them with protection and care in
29 order to ensure their healthy development. To date, much of the work on parenting self-
30 efficacy has focused on the birthing parent (e.g., mothers) excluding the non-birthing parent
31 (e.g., fathers and LGBTQ+ parents).

32 **Inclusion criteria:** Studies that include participants that identify as the non-birthing parent
33 (regardless of sex or gender) who have had an infant less than 12 months of age. Various
34 self-efficacy outcomes related to parenting will be included, as well as sub-types of self-
35 efficacy (e.g., chest/breastfeeding). No limitations based on context, geography, or parity will
36 be applied. All qualitative and quantitative study designs will be included.

37 **Methods:** Databases to be searched will include MEDLINE, Embase, Web of Science,
38 CINAHL, and PsycINFO with no time limitations applied. Title and abstracts and full text
39 will be screened by two reviewers with disagreements solved with a third reviewer. The data
40 extracted will include specific details about the population, study, methods, and outcomes.

41 Data will be reported narratively and in tables, as appropriate.

NOTE: This preprint reports new research that has not been certified by peer review and should not be used to guide clinical practice.

42 Introduction

43 Parenting self-efficacy has been defined as “beliefs or judgments a parent holds of
44 their capabilities to organize and execute a set of tasks related to parenting a child” (p.390).¹
45 Bandura, the pioneer of self-efficacy theory, suggested that the greater a person’s confidence
46 related to a specific behaviour (i.e., parenting), the more likely they are to engage in that
47 behaviour.² Thus, the development of parenting self-efficacy is an essential component in the
48 establishment of high-quality parenting habits that promote optimal child development.

49 Parenting self-efficacy can be examined targeting either general self-efficacy across
50 the parenting role or task specific self-efficacy (e.g., breastfeeding).³ In a systematic review
51 on self-report measures of parenting self-efficacy, Wittkowski et al.³ identified 34 different
52 measures, none of which have been consistently used in the literature. Furthermore, none
53 have been specifically developed for the non-birthing parent.⁴ There is also variation in the
54 level of self-efficacy measurement, which can include global (beliefs about an ability to
55 complete any task), domain-general (beliefs about being able to complete a specific task –
56 i.e., parenting), and domain-specific (beliefs about being able to complete a specific task in
57 certain area or conditions – i.e., breastfeeding, newborn stage).^{2,4} While global self-efficacy is
58 not applicable in the current review, both domain-general and domain-specific can be related
59 to parenting and parenting behaviours.

60 To date, much of the parenting self-efficacy work has focused on the birthing person
61 or mother. Maternal self-efficacy has been found to positively influence parenting behaviour,
62 which is associated with positive newborn and child outcomes.^{5,6} Various factors have been
63 found to influence feelings of maternal self-efficacy, including parity,^{7,8} levels of social
64 support,^{9,10} and postpartum anxiety and depression.^{11,12}

65 Overall, there has been a general lack of parenting self-efficacy research on the non-
66 birthing parent and the work completed thus far is disjointed. Previous work comparing
67 mothers and fathers’ found that mothers had greater parenting self-efficacy than fathers¹³
68 while others have found no difference.¹⁴ Importantly, paternal self-efficacy has been found to
69 be positively associated with supportive, early, and engaged parenting,^{15,16} suggesting that
70 fathers’ level of self-efficacy is important for child and family outcomes. Correlates of
71 greater paternal parenting self-efficacy have been found to contribute to a positive co-
72 parenting relationship,¹⁷ increased social support,¹⁴ enhanced parenting satisfaction,¹⁴ and

73 lower parenting stress.^{18,19} What is currently lacking is a collation and summarization of all
74 literature to date to guide future work.

75 There is even less research on parenting self-efficacy in non-heterosexual parenting
76 relationships, including various configurations of LGBTQ+ partners.^{20,21} This is despite a
77 growing number of non-heterosexual family structures, with the percentage of same-sex
78 child-rearing couples in Canada growing from 8.6% in 2001 to 12.0% in 2016.²² In Canada,
79 23.6% of the heterosexual population were considered parents with a child under the age of
80 18, compared to 13.4% of bisexual people and 6.2% of gay and lesbian individuals.²³ In the
81 United States, approximately 19% of same-sex couple households had a child under the age
82 of 18.²⁴ In one study that compared heterosexual-parents, gay-father families, and lesbian
83 mother-families no differences between family type on perceptions of parental self-efficacy.²⁵
84 Conversely, another study found that lesbian mothers, heterosexual mothers, and gay fathers
85 all reported higher parenting self-efficacy than heterosexual fathers. As the number of non-
86 heterosexual parents continue to grow, it is important to synthesize the current evidence
87 related to parenting self-efficacy in the non-birthing parent and to compare differences
88 among various populations (e.g., gay fathers, lesbian mothers, transgendered parents,
89 heterosexual fathers)

90 A preliminary search of MEDLINE, the Cochrane Database of Systematic Reviews
91 and JBI Evidence Synthesis was conducted and no current or underway systematic reviews or
92 scoping reviews on the topic were identified. The objective of this scoping review is to
93 identify and analyze the literature on parenting self-efficacy in the non-birthing parents
94 within the first year postpartum.

95 **Keywords**

96 Self-efficacy; paternal; LGBTQ+; scoping review

97 Eligibility Criteria

98 **Participants**

99 The review will consider studies that include participants that identify as the non-
100 birthing parent (regardless of sex or gender). Parenting self-efficacy will span the whole
101 postpartum period – from birth to 12 months post-birth. Both biological and adoptative
102 parents will be included, regardless of conception method (e.g., natural, surrogacy, in vitro
103 fertilization). No geographical or parity limitations will be applied. Parents of both full-term
104 and preterm infants will be included as well as singletons and multiples. Studies that solely
105 reported on maternal outcomes or did not separate out paternal outcomes (e.g., reports on
106 parents broadly) will be excluded. Studies that report across the perinatal period, including
107 the antenatal period, will be included.

108 **Concept**

109 This review will seek to map the data on parenting self-efficacy outcomes relevant to
110 the non-birthing parent (regardless of sex or gender) in their role as a parent as reported in the
111 literature. Studies reporting on domain-general (beliefs about being able to complete a
112 specific task – i.e., parenting self-efficacy) or domain-specific (beliefs about being able to
113 complete a specific task in certain area or conditions – i.e., breastfeeding self-efficacy) will
114 be included.

115 It is important to note that there is significant variation in terminology used to discuss
116 parenting self-efficacy. For instance, in the literature, parenting confidence, parenting self-
117 efficacy, and perceived competence have been used interchangeably with inconsistent
118 conceptual definitions.⁴ Given that parenting self-efficacy is the most consistently used term,⁴
119 this will be used throughout the review, with the understanding that some studies may
120 individually use the term competence and confidence. As such, these terms will be included
121 in the search strategy for this review in order to capture all relevant studies.

122 **Context**

123 Existing scoping reviews have primarily focused on qualitative studies looking at first
124 time fathers across the perinatal period²⁶ or included all first-time parents²⁷. Thus, there is a
125 gap in evidence synthesis on the experience of the non-birthing parent's parenting self-
126 efficacy and those who are multiparous.

127 **Type of Sources**

128 This scoping review will consider both experimental and quasi-experimental study
129 designs including randomized controlled trials, non-randomized controlled trials, before and
130 after studies and interrupted time-series studies. In addition, analytical observational studies
131 including prospective and retrospective cohort studies, case-control studies and analytical
132 cross-sectional studies will be considered for inclusion. This review will also consider
133 descriptive observational study designs including case series, individual case reports and
134 descriptive cross-sectional studies for inclusion.

135 Further, qualitative studies will be considered that include, but are not limited to,
136 designs such as phenomenology, grounded theory, ethnography, qualitative description,
137 action research and feminist research.

138 Mixed method studies will also be included. Reviews (systematic, non-systematic,
139 scoping, etc.) will be excluded but will be evaluated for original studies to be included, if
140 applicable. Letters to the editor, editorials, commentaries, conference abstracts, dissertations,
141 books, book chapters, and grey literature will not be included. If less than five peer reviewed
142 studies are available for analysis, preprints will be searched for additional studies. Otherwise,
143 preprints will not be included as they have not yet been peer-reviewed.

144 **Method**

145 This review will be reported following the PRISMA extension for Scoping Reviews²⁸
146 and will be conducted in accordance with the Joanna Briggs Institute (JBI) methodology for
147 scoping review.²⁹

148 **Search strategy**

149 The search strategy was developed in consultation with a health science librarian and
150 will aim to locate published studies. An initial limited search of MEDLINE was undertaken
151 to identify articles on the topic. The text words contained in the titles and abstracts of relevant
152 articles, and the index terms used to describe the articles were used to develop a full search
153 strategy for PSYCInfo (see Appendix 1). The search strategy was peer-reviewed by a second
154 health sciences librarian using the Peer Review of Electronic Search Strategies (PRESS)
155 Guideline³⁰ and refined according to the feedback received. The final search strategy,
156 including all identified keywords and index terms, will be adapted for each included database
157 and/or information source. Databases to be searched include MEDLINE All (Ovid), Embase
158 (Elsevier), CINAHL Full Text (EBSCO), Scopus (Elsevier), and PsycINFO (EBSCO). The

159 reference list of all included sources of evidence will be screened for additional studies using
160 Citation Chaser or Scopus. No time limitations will be applied.

161 **Study selection**

162 All identified citations through the search will be uploaded to Covidence³¹ and
163 duplicates will be removed through their automation process. After a pilot of
164 inclusion/exclusion criteria, title and abstracts and full text will be screened by two reviewers
165 with disagreements solved with a third reviewer or discussion. Reasons for exclusion at the
166 full-text stage will be reported. Results of the search will be reported in full in the final
167 scoping review and presented in a PRISMA flow diagram.²⁸

168 **Data extraction & synthesis**

169 The data extracted will include specific details about the population, study, methods,
170 and outcomes. Data extraction will be piloted before full data are extracted by one reviewer
171 and verified by another. The findings will be presented in narrative form including tables and
172 figures, where appropriate. For qualitative studies, data related to primary themes will be
173 extracted. For quantitative studies, data related to rates of self-efficacy, relation to other
174 populations (e.g., mothers), measurement tools, and correlated outcomes (e.g., stress, anxiety,
175 depression) will be extracted as available and appropriate. Consideration for population
176 characterises will be considered in the analysis (e.g., comparing parenting self-efficacy in
177 parents of full-term and pre-term infants).
