19 **Abstract**

20 **Background:** Nearly three in four U.S. medical students graduate with debt in six-figure
21 dollar amounts which impairs students emotionally and academically and impacts their career
22 choices and lives long after graduation. Schools have yet to develop systems-level solutions to
23 address the impact of debt on students' well-being. The objectives of this study were to identify
24 students at highest risk for debt-related stress, define the impact on medical students' well-being,
25 and to identify opportunities for intervention.

26 **Methods:** This was a mixed methods, cross-sectional study that used quantitative survey
27 analysis and human-centered design (HCD). We performed a secondary analysis on a national
28 multi-institutional survey on medical student wellbeing, including univariate and multivariate
29 logistic regression, a comparison of logistic regression models with interaction terms, and
30 analysis of free text responses. We also conducted semi-structured interviews with a sample of
31 medical student respondents and non-student stakeholders to develop insights and design
32 opportunities.

33 **Results:** Independent risk factors for high debt-related stress included pre-clinical year (OR
34 1.75), underrepresented minority (OR 1.40), debt \$20-100K (OR 4.85), debt >\$100K (OR
35 13.22), private school (OR 1.45), West Coast region (OR 1.57), and consideration of a leave of
36 absence for wellbeing (OR 1.48). Mental health resource utilization ($p= 0.968$) and counselors
37 ($p= 0.640$) were not protective factors against debt-related stress. HCD analysis produced 6 key

38 insights providing additional context to the quantitative findings, and associated opportunities for
39 intervention.

40 **Conclusions:** We used an innovative combination of quantitative survey analysis and in-
41 depth HCD exploration to develop a multi-dimensional understanding of debt-related stress
42 among medical students. This approach allowed us to identify significant risk factors impacting
43 medical students experiencing debt-related stress, while providing context through stakeholder
44 voices to identify opportunities for system-level solutions.

55

56 Introduction

57 Over the past few decades, it has become increasingly costly for aspiring physicians to
58 attend medical school and pursue a career in medicine. Most recent data shows that 73% of
59 medical students graduate with debt often amounting to six-figures¹ – an amount that is steadily
60 increasing every year.² In 2020, the median cost of a four-year medical education in the United
61 States (U.S.) was \$250,222 for public and \$330,180 for private school students¹ – a price that
62 excludes collateral costs such as living, food, and lifestyle expenses. To meet these varied costs,
63 students typically rely on financial support from their families, personal means, scholarships, or
64 loans. Students are thereby graduating with more debt than ever before and staying indebted for
65 longer, taking 10 to 20 years to repay their student loans regardless of specialty choice or
66 residency length.¹

67 Unsurprisingly, higher debt burden has been negatively correlated with generalized
68 severe distress among medical students,^{3,4} in turn jeopardizing their academic performance and
69 potentially impacting their career choices.⁵ Studies have found that medical students with higher
70 debt relative to their peers were more likely to choose a specialty with a higher average annual
71 income,⁵ less likely to plan to practice in underserved locations, and less likely to choose primary
72 care specialties.⁴ However, a survey of 2019 graduating medical students from 142 medical
73 schools found that, when asked to rank factors that influenced their specialty choice, students
74 ranked economic factors, including debt and income, at the bottom of the list. With this
75 inconsistency in the literature, authors Youngclaus and Fresne declare that further studies and
76 analysis are required to better understand this important relationship.¹

77 Unfortunately, debt and its negative effects disproportionately impact underrepresented
78 minority (URM) students, including African Americans, Hispanic Americans, American Indian,
79 Native Hawaiian, and Alaska Native,⁶ who generally have more debt than students who are
80 White or Asian American.¹ In 2019, among medical school graduates who identified as Black,
81 91% reported having education debt, in comparison to the 73% reported by all graduates.¹
82 Additionally, Black medical school graduates experience a higher median education debt amount
83 relative to other groups of students, with a median debt of \$230,000.¹ This inequitable
84 distribution of debt disproportionately places financial-related stress on URM students,⁷
85 discouraging students from pursuing a medical education.⁸ These deterring factors can lead to a
86 physician workforce that lacks diversity and compromises health equity outcomes.⁹

87 Limited literature exists to identify the impact of moderating variables on the relationship
88 between debt and debt-related stress. Financial knowledge is found to be a strong predictor of
89 self-efficacy and confidence in students' financial management, leading to financial optimism
90 and potentially alleviating debt stress.¹⁰⁻¹² Numerous studies list mindfulness practices, exercise,
91 and connecting with loved ones as activities that promote well-being and reduce generalized
92 stress among students.¹³⁻¹⁵ However, to date, no studies have examined whether these types of
93 stress-reducing activities, by alleviating generalized stress, reduce debt-related stress. Studies
94 have not examined whether resources such as physician role models may act as a protective
95 factor against debt-related stress.

96 Despite the growing recognition that debt burdens medical students emotionally and
97 academically, we have yet to develop systemic solutions that target students' unmet needs in this
98 space. We performed the first multi-institutional national study on generalized stress among

99 medical students, and found that debt burden was one of several risk factors for generalized
100 stress among medical students.³ The goal of this study is to build upon our findings by using a
101 mixed methods approach combining rigorous survey analysis and human-centered design to
102 develop an in-depth understanding of the impact that education debt has on medical students'
103 emotional and academic well-being and to identify opportunities for intervention.

104 **Methods**

105 We conducted a mixed methods, cross-sectional study that explored the impact of debt-
106 related stress on US medical students' well-being and professional development. This study was
107 conducted at the University of California, San Francisco (UCSF). All activities were approved
108 by the UCSF institutional review board. We performed a secondary analysis of the quantitative
109 and qualitative results of the Medical Student Wellbeing Survey (MSWS), a national multi-
110 institutional survey on medical student wellbeing administered between 2019-2020, to determine
111 risk factors and moderating variables of debt-related stress. To further explore these variables,
112 we used human-centered design (HCD), an approach to problem-solving that places users at the
113 center of the research process in order to determine key pain points and unmet needs, and co-
114 design solutions tailored to their unique context.¹⁶ In this study, we performed in-depth, semi-
115 structured interviews with a purposefully sampled cohort of medical students and a convenience
116 sample of non-student stakeholders to determine key insights representing students' unmet
117 needs, and identified opportunities to ameliorate the impact of debt-related stress on medical
118 students.

119 **Quantitative Data: The Medical Student Wellbeing Survey**

120 The MSWS is a survey to assess medical student wellbeing that was administered from
121 September 2019 to February 2020 to medical students actively enrolled in accredited US or
122 Caribbean medical schools.³ Respondents of the MSWS represent a national cohort of >3,000
123 medical students from >100 unique medical school programs. The MSWS utilizes a combination
124 of validated survey questions, such as the Medical Student Wellbeing Index (MS-WBI), and
125 questions based on foundations established from previously validated wellbeing survey
126 methods.³ Questions generally focused on student demographics, sources of stress during
127 medical school, specialty consideration, and frequency in activities that promote wellbeing.
128 Some questions ask students to rate physical, emotional, and social domains of wellbeing using a
129 five-point Likert scale. Questions of interest from the MSWS included debt-related stress,
130 generalized stress, intended specialty choice, and utilization of well-being resources and
131 counselors. An additional variable investigated was average school tuition, which was
132 determined by a review of publicly available data for each student's listed medical school.¹⁷

133 **Stress: Debt-Related and Generalized Stress**

134 Debt stress was assessed by the question, "How does financial debt affect your stress
135 level?" Students responded using a five-point Likert scale from -2 to 2: significant increase in
136 stress (-2), mild increase (-1), no change (0), mild decrease (1), or significant decrease (2).
137 Responses for this question were evaluated as a binary index of 'high debt stress,' defined as a
138 response of -2, versus 'low debt stress,' defined as a response of -1 or 0. In addition, generalized
139 stress from the MSWS was assessed by questions from the embedded MS-WBI, which produced
140 a score. Previous studies have shown that the score can be used to create a binary index of

141 distress: a score \geq has been associated with severe distress, and a score <4 has been associated
142 with no severe distress.¹⁸

143 **Intended Specialty**

144 We categorized students' responses to intended specialty choice by competitiveness,
145 using the 2018 National Resident Match Program data.¹⁹ 'High' and 'low' competitiveness were
146 defined as an average United States Medical Licensing Examination (USMLE) Step 1 score of
147 >240 or ≤ 230 , respectively, or if $>18\%$ or $<4\%$ of applicants were unmatched, respectively.
148 'Moderate' competition was defined as any specialty not meeting criteria for either 'high' or
149 'low' competitiveness.

150 **Resource Utilization**

151 The MSWS assessed utilization of well-being resources by the question, "At your
152 institution, which of the following well-being resources have you utilized? (Select all that
153 apply)" Students responded by selecting each of the resource(s) they used: Mental Health and
154 Counseling Services, Peer Mentorship, Self-Care Education, Mindfulness/Meditation Classes,
155 Community Building Events, and Other. The number of choices that the student selected was
156 calculated, allowing for placement into a category depending on the amount of resource
157 utilization: 0-20%, 20-40%, 40-60%, 60-80%, 80-100%. Responses for this question were
158 evaluated as a binary index of 'high resource utilization,' defined as a response of 80-100%
159 resource utilization, versus 'low resource utilization,' defined as a response of $<80\%$ resource
160 utilization. Additionally, use of a counselor for mental health support was assessed by the
161 question, "Which of the following activities do you use to cope with difficult situations (or a

162 difficult day on clinical rotation)? (Select all that apply)” Students responded by selecting the
163 activities that they use from a list, which included: Listen to Music, Mindfulness Practice, Meet
164 with a Counselor, Exercise, etc. Responses for this question were evaluated as a binary index of
165 ‘Meeting with a Counselor,’ defined by selection of that option, versus ‘Not Meeting with a
166 Counselor,’ defined as not selecting that option.

167 **Quantitative Data Analysis**

168 We performed a secondary analysis of quantitative data from the MSWS to calculate
169 frequencies and odds ratios for the five quantitative variables described above (debt-related
170 stress, generalized stress, intended specialty, resource utilization, and school tuition). Univariate
171 analysis and multivariate logistic regression were performed among students in the high debt
172 stress (-2) and low debt stress (0 or -1) for select variables, such as clinical phase, URM, debt
173 burden, specialty competitiveness, and average school tuition among others to identify risk
174 factors for high debt stress. To determine if ‘high resource utilization’ or ‘meeting with a
175 counselor’ were moderating variables on the relationship between debt burden and debt stress,
176 we applied the logistic regression with the interaction terms of ‘debt’ and ‘resource utilization’
177 (high vs. low). Then, we performed a similar analysis but replaced the interaction term with
178 ‘debt’ and ‘meeting with a counselor’ (yes vs. no). We also performed Chi-squared tests to
179 determine the degree to which severe distress increases as debt burden increases, if specialty
180 competitiveness varied by debt stress, and if the proportion of students who identified as URM,
181 in comparison to non-URM, differed by debt level. All statistical tests were two-sided and p

182 <0.05 was considered significant. Statistical analyses were performed using SAS version 9.4 and
183 R version 4.0.5.

184 **Qualitative Data: Interviews and MSWS Free Text Responses**

185 **Free-Text Entries**

186 At the conclusion of the 2019-2020 MSWS, respondents had unlimited text space to
187 provide comments to two prompts. The first prompt read, "What well-being resource(s), if
188 offered at your school, do you feel would be most useful?" The second prompt read "If you have
189 any further comments to share, please write them below." Answers to either prompt that
190 pertained to debt, cost of medical school, or finances were extracted for the purpose of this study
191 and analyzed with the other qualitative data subsequently described.

192 **Interview Selection & Purposive Sampling**

193 Interview participants were identified from a repository of respondents to the MSWS
194 who had attached their email address and expressed willingness at the time of the survey to be
195 contacted for an interview.³ Our recruitment period was between April 19, 2021 to July 2, 2021.
196 The recruitment process involved sending invitations to all of the email addresses in the list to
197 participate in a 45-minute interview on the topic of student debt and wellbeing. The invitation
198 included a brief screening questionnaire asking students to report updates to questions that were
199 previously asked in the MSWS (i.e.: clinical training year, marital status, dependents).
200 Additional novel questions included primary financial support system, estimate of financial
201 support systems' household income in the last year, estimate of educational financial debt at

202 conclusion of medical school, student’s plan for paying off debt, and degree of stress (using a
203 Likert scale from 0-10) over current and future education debt.

204 Purposeful sampling of medical student stakeholders for interviews allowed us to
205 maximize heterogeneity. We utilized the students’ responses to the brief screening questionnaire
206 with their corresponding responses to demographic questions from the MSWS to select
207 interviewees that varied by gender, race, presence of severe distress, type of medical school
208 (public vs. private), region of school, and tuition level of school. The sampling ensured a diverse
209 representation, in accordance with HCD methodology.²⁰ Brief descriptions of participant
210 experiences are listed in **Table 2** (“Interviewee Descriptors”). Students who were selected for
211 interviews were sent a confirmation email to participate. In addition, to include representation
212 from the entire ecosystem, we interviewed a financial aid counselor at a medical school and a
213 pre-medical student, chosen through convenience sampling. We directly contacted those two
214 individuals for interviews.

215 **Semi-Structured Interviews**

216 All interviews were conducted between April 2021 and July 2021 over Zoom, a
217 collaborative, cloud-based videoconferencing service offering secure audio recordings of
218 sessions. A single researcher conducted interviews over an average of 45 minutes. Informed
219 consent was obtained verbally from participants prior to interviews; interviews and their
220 recordings only proceeded following verbal consent. The interview guide (S1 File) included
221 open-ended questions about students’ experience of debt-related stress and their reflections on its
222 consequences. The audio recordings were transcribed using Otter.ai, a secure online transcription

223 service that converts audio files to searchable text files. Interview responses were redacted to
224 preserve anonymity of respondent identity.

225 **Qualitative Data Analysis**

226 Interview data was analyzed using a general inductive approach to thematic analysis.
227 Specifically, two researchers (SL and AY) independently inductively analyzed transcripts from
228 the first three semi-structured interviews to come up with themes relating to the experiences and
229 consequences of debt-related stress. They reconciled discrepancies in themes through discussion
230 to create the codebook (S2 File), which included 18 themes. SL and AY independently coded
231 each subsequent interview transcript as well as the free text responses from the survey, meeting
232 to reach a consensus on representative quotes for applicable themes.

233 The two researchers met with the core research team to extrapolate ‘insight statements’
234 from the themes that emerged from the thirteen interviews, deducing unique human perspectives,
235 motivations, or tensions from the thematic data following the HCD methodology.²¹ These insight
236 statements articulate key challenges experienced by stakeholders, and provide the basis for
237 design opportunities that lead to collaborative co-design processes for solution development. In
238 HCD, design opportunities are statements derived directly from the insight and are framed in a
239 way that suggest that multiple solutions are possible. These design opportunities are used during
240 brainstorming sessions, where creativity and innovation are encouraged in the co-design
241 process.²²

242 **Results**

243 **MSWS Respondents and Quantitative Analysis**

244 A total of 3,162 students responded to the MSWS and their sociodemographic
 245 characteristics have been described previously.³ A total of 2,771 respondents (87.6%) provided
 246 responses for our study’s variables of interest, including a response for ‘high debt stress’ (–2) or
 247 ‘low debt stress’ (–1 or 0). **Table 1** lists the distribution of debt-related stress across different
 248 variables for all respondents.

249 **Table 1. Summary statistics of debt stress level for different variables (N=3,162)**

		Reported Level of Stress (Likert Scale) Associated with Medical School Debt					
		N (%)					
Variable		Overall	Significant increase in stress (-2)	Mild increase in stress (-1)	No change in stress (0)	Mild decrease in stress (1)	Significant decrease in stress (2)

252 ^c Non-Metropolitan: includes urban cluster, small urban area, medium-size urban area

253 ^d Metropolitan: includes large metropolitan, metropolitan

254 **Table 2. Interviewee Descriptors**

		Summary of Interviewees
Student Stakeholders	1	2nd-year male student with high debt stress, who is married and pursuing a highly competitive specialty
	2	2nd-year female student with low debt stress, who comes from a low-income background with receives financial support
	3	Gap year (PhD years of MD/PhD program) female student with low debt stress, who comes from a wealthy background and is pursuing a lower paying specialty
	4	2nd-year female immigrant student with high debt stress, pursuing a lower paying specialty and a career of advocacy
	5	3rd-year female student with low debt stress, who is married and receives financial support
	6	4th-year female student with low debt stress, who identifies as URM and is graduating debt-free due to financial aid
	7	3rd-year male student with low debt stress, who is enrolled in an MD/PhD program and is receiving financial support from his fiancée
	8	4th-year male student with low debt stress, who took out loans and is pursuing a higher paying specialty
	9	2nd-year female student with low debt stress, who took out loans and is enrolled in a 7-year medical program (including college and medical school)
	10	1st-year female student with low debt stress, who receives scholarships for medical school and whose parent is a physician
	11	1st-year female immigrant student with low debt stress, who identifies as URM and is pursuing a lower paying specialty
Non-Student Stakeholders	12	Pre-medical female student with high debt stress, who identifies as a "career changer" and is enrolled in a postbaccalaureate program
	13	Medical school financial aid counselor

256 **Risk Factors for Debt-Related Stress**

257 Factors that were independently associated with higher debt-related stress included being in pre-
 258 clinical year (OR 1.75, 95% CI 1.30-2.36, $p < 0.001$), identifying as URM (OR 1.40, 95% CI
 259 1.03-1.88), $p = 0.029$), having debt \$20-100K (OR 4.85, 95% CI 3.32-7.30, $p < 0.001$), debt >100K
 260 (OR 13.22, 95% CI 9.05-19.90, $p < 0.001$), attending a private medical school (OR 1.45, 95% CI
 261 1.06-1.98, $p = 0.019$), attending medical school on the West Coast (OR 1.57, 95% CI 1.17-2.13,
 262 $p = 0.003$), and having considered taking a leave of absence for wellbeing (OR 1.48, 95% CI 1.13-
 263 1.93, $p = 0.004$) (Table 3, S1 Table).

264 **Table 3. Predictors of high debt stress in medical students using a multivariable logistic**
 265 **regression model (N=2,771)**

	Univariate Analysis		Multivariate Analysis	
	Odds Ratio (95% CI)	P-Value	Odds Ratio (95% CI)	P-Value
Medical School Year (vs. Clinical)				
Pre-clinical	0.97 (0.77-1.24)	$p = 0.832$	1.75 (1.30-2.36)	$p < 0.001^*$
Gap Year/Other	1.11 (0.70-1.71)	$p = 0.658$	1.09 (0.63-1.86)	$p = 0.748$
Post-clinical	0.88 (0.66-1.16)	$p = 0.355$	0.85 (0.62-1.17)	$p = 0.310$

Gender (vs. Male)				
Non-Male	1.13 (0.93-1.37)	p=0.221	1.22 (0.97-1.53)	p=0.085
Marital Status (vs. Never Married)				
Married	1.16 (0.88-1.51)	p=0.284	1.07 (0.78-1.45)	p=0.684
Divorced / Widowed	1.72 (0.60-4.39)	p=0.272	1.02 (0.33-2.84)	p=0.973
Disability (vs. No**)				
Yes	1.17 (0.85-1.58)	p=0.324	0.95 (0.66-1.34)	p=0.760
URM (vs. No)				
Yes	1.57 (1.20-2.04)	p=0.001 *	1.40 (1.03-1.88)	p=0.029*
Debt Burden (vs. <20K)				
20-100K	4.94 (3.46-7.24)	p<0.001 *	4.85 (3.32-7.30)	p<0.001*
>100K	10.51 (7.47- 15.22)	p<0.001 *	13.22 (9.05- 19.90)	p<0.001*
Specialty Competitiveness (vs. High)				

Low	1.21 (0.92-1.61)	p=0.188	1.11 (0.69-1.78)	p=0.669
Moderate	1.45 (1.09-1.95)	p=0.012 *	1.31 (0.93-1.87)	p=0.131
Specialty Category (vs. Surgical)				
Medical	0.98 (0.75-1.28)	p=0.855	1.02 (0.64-1.61)	p=0.940

Private	1.15 (0.96-1.38)	p=0.125	1.45 (1.06-1.98)	p=0.019*
Region (vs. Non-Coastal)				
Northeast	0.90 (0.72-1.11)	p=0.312	0.96 (0.72-1.29)	p=0.798
West Coast	1.13 (0.90-1.42)	p=0.284	1.57 (1.17-2.13)	p=0.003*
City Character (vs. Non-Metropolitan)				

Metropolitan	0.93 (0.77-1.11)	p=0.409	0.92 (0.71-1.18)	p=0.508
School Average Tuition (vs. <40K)				
40-60K	1.26 (0.95-1.69)	p=0.122	0.95 (0.68-1.35)	p=0.774
>60K	1.31 (0.95-1.83)	p=0.102	0.91 (0.60-1.37)	p=0.648
Leave of Absence for Wellbeing (vs. Never Considered)				
I have considered taking a leave of absence from school for my personal well-being	1.58 (1.26-1.98)	p<0.001 *	1.48 (1.13-1.93)	p=0.004*
I have taken a leave of absence from school for my personal well-being	1.54 (0.99-2.35)	p=0.050	1.34 (0.78-2.25)	p=0.276

266 *Statistically significant at p<.05

267 **Includes: ‘no’ and ‘I’d prefer not to say’

268

269 **Severe Distress by Debt Amount**

270 Levels of generalized severe distress differed across debt burden groups. As debt level increased,

271 the percentage of individuals with “severe” distress increased (p <0.001).

272 **Debt and Career Decisions**

273 There were significant differences between the high debt stress versus low debt stress groups and
274 plans to pursue highly vs. moderately vs. minimally competitive specialties ($p=.027$) (**Fig 1**). A
275 greater percentage of low debt stress students were pursuing a highly competitive specialty or a
276 minimally competitive specialty. A greater percentage of high debt stress students were pursuing
277 a moderately competitive specialty. As shown in **Table 3**, there were no differences in debt-
278 associated stress between students who choose different specialties, such as medical versus
279 surgical versus mixed (medical/surgical).

280 **Fig 1. Debt Stress by Specialty Competitiveness**

281

282 **URM Students' Experience of Debt**

283 URM identity was an independent risk factor for higher debt-related stress (**Table 3**). In addition,
284 debt levels varied between those who identify as URM versus non-URM ($p < 0.001$). Students
285 identifying as URM tended to have higher debt than those who did not. Although the percentage
286 of non-URM students was higher than that of URM students within the lowest debt burden
287 category ($< \$20k$), among all higher debt burden categories, including $\$20-100K$, $\$100-300K$,
288 and $> \$300K$, the percentage of URM students was higher than the percentage of non-URM
289 students.

290 **Moderating Factors on the Relationship Between Debt and Debt Stress**

291 Protective factors such as high degree of mental health resource utilization and meeting with a
292 counselor did not reduce the impact of debt burden on debt stress. Among students who reported
293 a high degree of mental health resource utilization, there was no impact on the relationship
294 between debt and debt stress ($p = 0.968$). Similarly, meeting with a counselor had no impact on
295 the relationship between debt and debt stress ($p = 0.640$).

296 **Interview Respondents and Qualitative Analysis**

297 We conducted in-depth, semi-structured interviews with 11 medical students, who are
298 briefly described in **Table 2**. Among the medical student interviewees, there was representation
299 from all regions, including the Northeast ($n=3$), West Coast ($n=5$), Midwest ($n=2$), and South
300 ($n=1$). Students were also from all clinical phases, including pre-clinical ($n=3$), clinical ($n=4$),
301 gap year/other ($n=2$), and post-clinical ($n=2$). Most interviewees were female ($n=8$) and 5 of the
302 interviewees identified as URM. Financial support systems were diverse, including self ($n=3$),
303 spouse/partner ($n=3$), and parents/other ($n=5$). Most interviewees reported low debt stress ($n=8$),
304 as opposed to high debt stress ($n=3$). Fifty-five percent of interviewees planned to pursue
305 specialties that pay $< \$300K$ ($n=6$), with some pursuing specialties that pay $\$300-400K$ ($n=2$) and
306 $> \$400K$ ($n=3$).

307 Among the MSWS free-text responses, to the prompt, "What well-being resource(s), if offered at
308 your school, do you feel would be most useful?" 20 of 118 respondents (16.9%) provided free-
309 text responses that pertained to debt, cost of medical school, or finances. To the prompt "If you
310 have any further comments to share, please write them below" 11 of 342 students (3.2%)
311 provided relevant free-text responses. Analysis of the free-text responses and semi-structured

312 interviews revealed 6 distinct insights (**Table 4**), with each insight translated into an actionable
 313 design opportunity.

314 **Table 4. Representative Quotes for Each Insight**

Insight and Representative Quotes	
Insight 1:. Medical school is a risky investment for low-income students.	
Theme 1a: Questionable Job Security	1a.1 "Having an MD salary means financial security, wherever you are. And I know I'm going to be okay."
	1a.2 "I wanted to do radiation oncology and still kind of want to but the whole rumors signaling the job market really scared me."
	1a.3 "That future is not totally certain. So it may be that I don't get the high paying job that I would need to pay it off. Or it could be that there are healthcare reforms and doctors salaries go down."
	1a.4 "I worry that there will be more equity issues from students not being able to take on debt because they're less confident that their compensation down the line will allow them to pay off that debt."
	1a.5 "I'm just really fortunate that the things in life that I'm passionate about [medicine], do pay well, fingers crossed, and I will have some sense of financial security and financial prosperity."
Theme 1b: Disappointing MD Salary and Satisfaction Payoff	1b.1 "I get so pissed when some of my friends or acquaintances from other programs that tell me like, 'oh, you're gonna be a doctor, you'll pay it off.' Like, you're in an MBA program and once you graduate, you're going to be making 50 to 100k way before I even get to see a six figure salary."
	1b.2 "There are other health care professionals (ie: NPs and PAs) that will not accrue the same amount of loans that we will, and then may or may not have the same salary or privileges depending on where they work...makes me question, Did I do the right thing [going to medical school]?"
	1b.3 "Doctors' salaries are not this luxury thing that people think anymore.. You want quick, easy money? If you want the big money, you go into [computer science] CS, you go into consulting."

	<p>1b.4 "It's ridiculous that we put in 4 years to get into serious debt, then another 4 years of on average getting less than minimum wage, and then go on to be an attending where you work long hours and face risk of malpractice at all times. If I had to do it all over again medicine would not be my choice."</p>
	<p>1b.5 "I won't start having or like making significant amounts of money to live a comfortable life until I'm much older. And that's like really like frustrating to think that I won't be until I'm like 40 or even 50 will I be able to live comfortably. And it's like at that point, how much of my life is gone."</p>
	<p>1b.6 "I do think obviously you are helping people, you are making a difference, but I don't think [being a doctor is] as profound or as meaningful as I thought"</p>
<p>Design Opportunity 1: Support low-income students to make values-based tradeoffs when considering a career in medicine.</p>	
<p style="background-color: #cccccc;"></p>	
<p>Insight 2: Medical schools lack the adaptive infrastructure to be welcoming to low-income students.</p>	
<p>Theme 2a: Financial Barriers to Applying to Medical School</p>	<p>2a.1 "When I was applying for med schools, finances were, for example, restricting me in terms of number of schools I applied and in terms of the location."</p>
	<p>2a.2 "I would have loved to take one of those Kaplan courses for taking the MCAT but for me, I just could not afford it and I just was like, 'No, I'm just going to study myself and see what happens.'"</p>
	<p>2a.3 "MCAT tutoring is costly and the kids that are going to get the perfect scores they are maybe the ones who have extra prep, where they can pay for those types of things."</p>
	<p>2a.4 "When some people have so many other competing financial challenges, like family and other responsibilities... there are definitely people who have not gone to medical school that would have wanted to if costs were not prohibitive."</p>

Theme 2b: Financial Obligations for Low-Income Families	2b.1 "I end up having the most fluid income of anyone in my family, because my parents live paycheck to paycheck and if the paycheck hadn't come, they couldn't afford the health bill or the car repair or whatever."
	2b.2 "My scholarships certainly did get spread out over my family whenever something was needed."
	2b.3 "And one thing that I was worried about going to [private school] is that the person who I list on my FAFSA...is my father, and my father is manipulative, he lies."
	2b.4 "[When a student has to include a family member on the FAFSA form] I can only imagine what happens if you have a parent who has a significant substance use disorder and doesn't have a job or is like MIA or is just really unreliable."
Theme 2c: Incomplete Financial Support	2c.1 "I think it would have been easier if I didn't have to work on top of school, I do have to admit, and sometimes I got a little jealous of others who didn't necessarily have to do that and could just like do their school, and whatever else they wanted to."
	2c.2 "It would be great if [medical schools] could provide more financial aid for like a more gradual transition. If your family makes under \$125k, you're fine, between \$125k and \$165k...you go from full support, to no support. And I think that that's way too steep."
Design Opportunity 2: Develop flexible systems that can recognize and accommodate students' complex financial needs during medical school.	
Insight 3: Students worry about the impact that their medical school debt has on their present and future families, which compounds feelings of guilt and anxiety.	
Theme 3a: Debt as a Family Sacrifice	3a.1 "With every step I take [to get further training for my career], I potentially put [my partner] back, which then puts our total household income back."
	3a.2 "The family's going to school."
	3a.3 "So I turned down the spot as a MD/PhD when I was a senior year of undergrad because at that point, I was pretty convinced that MD/PhD wouldn't let me go the way I want to go. And so yeah, so my parents were mad at me... I turned [the MD/PhD program] down in the same phone call. And [my parents were] like...'That's like a \$250,000 decision. You didn't even ask us first.'"

	<p>3a.4 "I am going to marry someone who works in education. He'll probably only make 100,000 a year, if that, depending on the state we live in and depending on the county he serves. He told me this weekend, his ideal plan is that we're engaged by next summer, and he would be happy with a two-year engagement. And we would be getting married once I graduate med school. And then we basically have a year to get pregnant because he doesn't want to be a certain age, when he has his first kid...And so I stress a lot about the fact that I'm only going to be making \$70,000 on a residency salary."</p>
	<p>3a.5 "I think I was really stressed out when we had that first conversation [with my parents] about me taking out a loan in order to pay off my medical school education... I also know... in terms of financial support, it makes more sense for [my parents] to help my sister out as much as possible. And then for me to chip in after I take care of my loans, if she still needs that support."</p>
Theme 3b: Pressure to Provide Financially	<p>3b.1 "Being of low SES, the most significant stressor for me is the financing of medical school and the pull of responsibilities to my family."</p>
	<p>3b.2 "I'm gonna roll in [to marriage] with however many thousands of dollars of debt I'll have by the end of fourth year, and be like, 'Hey, you're marrying me. I don't know what it's going to be like for us.'"</p>
	<p>3b.3 "I am so education-focused, and there isn't really anything else besides that, but then I see my friends get engaged and get married, and then think about having kids at the right times, and I'm like, Oh my God. That's a lot to be dealing with during medical school. All I have to do is worry about is this."</p>
	<p>3b.4 "The pressure to provide [for my future family] is definitely there."</p>
Design Opportunity 3: Create an environment that acknowledges and accounts for the burden of responsibility that students face towards their families.	
Insight 4: Without the appropriate education about loans, the stress of debt is exponentially worse.	
Theme 4a: Missing Roadmap for Becoming Debt-Free	<p>4a.1 "Nobody in my family is in medicine, so nobody really knows the process. So, everything that I know is from the internet or from a friend and that does scare me."</p>
	<p>4a.2 "I don't know what my options are."</p>

	<p>4a.3 "One of my fears is that I don't know what I don't know. I really have no idea how I'm going to pay for [medical school and medical training], what that's going to look like"</p>
	<p>4a.4 "The biggest worry is, what if [the debt] becomes so large that I am never able to pay it off and it ends up ruining me financially. I guess for me, that means that I never have enough money in my bank account to buy food or make normal bill payments, or if I have kids, I can't do fun things."</p>
	<p>4a.5 "It [the total cost of medical school] is just like such a giant number that it's hard to wrap your head around."</p>
<p>Theme 4b: Resources About Loans and Debt Payoff</p>	<p>4b.1 "Once [students] just have some of that general information, it really helps mental wellbeing, because instead of it being some sort of mystery, 'Oh, my gosh, I took out all this debt, I don't know what I'm going to be doing with it once I'm done,' they do have somewhat of a plan and somewhat of an idea of what's going to be coming afterwards."</p>
	<p>4b.2 "When [the financial aid counselor] broke down the math, the way the interest works, he's like, 'it saves you nothing to pay it off this timeline versus this one.' And so I have a better sense of like, 'Oh, I can have the life I want of the house and the family and the career and get my loans paid off and have retirement and savings.' And so there is peace of mind that I have a plan."</p>
	<p>4b.3 "They [the financial aid counselors] had a little presentation just about how we were expected to pay the debt off and kind of their plan; it was nice to see that there was a way to do it."</p>
	<p>4b.4 "I do kind of feel bad for people who don't have somebody to do research and worry about it [loans] because that's just another thing on you."</p>
	<p>4b.5 "[Having a father as a physician] I had a good idea of what that [medical school cost] was going to be. And the understanding that that cost is on the horizon. Also, understanding that, you know, with compensation down the line, that can be a worthwhile investment to do."</p>
	<p>4b.6 "I've had explicit discussions with physicians who went to med school, had debt, paid it off or are still paying it off, and hearing from them and still seeing that they're able to take trips whenever they want to or seeing that the debt hasn't hindered their life in any way, I think that just kind of makes me feel a lot calmer than I think the average person would."</p>

Design Opportunity 4: Empower students to become experts in managing their debt by making loan-related resources more available and accessible.	
Insight 5: The small, daily expenses are the most burdensome and cause the greatest amount of stress.	
Theme 5a: Different Types of Costs	5a.1 "My parents contributing to my food and living would make me think a little bit less about how I'm spending my money every single day, as opposed to just focusing, work and studying to school. And I feel better that my loans are just for tuition, as opposed to knowing that every dollar that I do spend, if I taken out a loan for living as well, is not actually my money, and it's something that's contributing to something that I'll have to pay off in the future. I would definitely skimp out on purchasing certain things."
	5a.2 "I remember talking with my mom, and she didn't understand why I had [private school] on the list, but I didn't have [private school] and [private school]. And I was like, 'well, Boston is like five times as expensive as Baltimore. I think I'll be too stressed to actually do well in medical school."
	5a.3 "It's easier for me to think about [loans as] some amount that the school gets, that I never see. And then the other amount is something that I actually do see, and I actually get to use and put towards living."
Theme 5b: Lifestyle Adjustments	5b.1 "I only have to buy groceries for myself, like twice a month because I might not have the healthiest relationship with food. So I eat the exact same thing like all the time I eat my rice and beef bowl, or my rice and chicken bowl lunch and dinner every day. It's been great. So that has allowed me to actually finish off the school year with an extra \$7000 that I wasn't anticipating."
	5b.2 "I usually cut costs when it came to food, like I did not eat out. I still do not eat out very often. I cook most of my own meals. I don't necessarily go out, like my entertainment budget is very small."
	5b.3 "I always over-estimate [my budget] and then hope to spend less."
	5b.4 "I'm really big on walking places or using public transit to get places whenever I can. I'm always thinking about turning off the lights in my house and making sure that things are not just running because the gas bill can be pretty high."
Design Opportunity 5: Develop and distribute resources to support both short- and long-term financial costs for medical students.	

Insight 6: Students view debt as a dark cloud that constrains their mental health and dictates their career trajectory.	
Theme 6a: Mental Health Impact	6a.1 "I don't know how [debt is] gonna affect my marriage, but I imagine it will, in some way, because my partner doesn't have any debt."
	6a.2 "I feel like it's just emotional fear...that the debt will shape at least for some number of years, my expenses, and my budget."
	6a.3 "As long as you're in debt, you're owned by someone or something and the sooner you can get out of it, the better; the sooner I can get started with my life."
Theme 6b: Academic Performance Impact	6b.1 "I feel like I'm spending so much time and emotional mental energy on addressing my financial needs, while some of my peers can just focus purely on their career development."
	6b.2 "I definitely would feel constant financial issues that I had running in the back of my mind. That definitely affected my ability to concentrate and focus on things, and I felt like it ran my battery down."
	6b.3 "It's like a weight off my shoulders [to not have educational debt]. I feel like you can just focus."
Theme 6c: Specialty Choice Impact	6c.1 "Because of [financial aid that] I have gotten at [private school], I'm able to be a lot more flexible in what I choose as a specialty."
	6c.2 "I think it [scholarships] give me the freedom to do [specialties] that maybe are a little bit less well-paying in medicine."
	6c.3 "I would say that the finances are really deterring me from medical specialties that just don't pay well."
	6c.4 "I was worried how much debt I had racked up in undergrad and then grad school...I thought to myself, if I don't get into medical school and get a high paying career, I have no clue how I'm going to pay off like ~\$100,000 in loans."
	6c.5 "The specialties that I'm most interested in are not high paying specialties. That part is nice, just knowing that I'm not in a position where I really have to weigh income and potentially make a trade off between how much I get paid versus doing what I want to do."
	6c.6 "I loved pediatrics, I love working with the kids... but being an outpatient pediatrician just wasn't going to be enough to justify the [private school] price tag."

Design Opportunity 6: Create a culture of confidence for managing debt and debt-stress among medical students.

315

316 *Insight 1:* Medical school is a risky investment for low-income students.

317 *Description:* The personal and financial sacrifices required for low-income students to attend
318 medical school and pursue a career in medicine outweigh the benefits of becoming a physician.
319 When considering a career in medicine, students feel discouraged by questionable job security
320 (theme 1a) and reduced financial compensation (theme 1b) – a combination that jeopardizes
321 immediate and long-term job satisfaction. Some students feel hopeful that their decision to
322 pursue medicine will be personally rewarding (1b.6) and their salaries will stabilize (1a.1, 1a.5),
323 but many low-income students experience doubt about whether they made the right career choice
324 (1b.2, 1b.4, 1b.6), and feel stressed that they will be in debt for longer than they expected (1a.3,
325 1a.4, 1b.1, 1b.5). **Support low-income students to make values-based tradeoffs when considering a
326 career in medicine.**

327 *Design Opportunity:* Support low-income students to make values-based tradeoffs when
328 considering a career in medicine.

329

330 *Insight 2:* Medical schools lack the adaptive infrastructure to be welcoming to low-income
331 students.

332 *Description:* Students face financial challenges from the moment they apply to medical school
333 (theme 2a), a costly process that limits admissions options for low-income students due to their
334 inability to pay for numerous application fees (2a.1) and expensive test preparation courses (2a.2,

335 2a.3). Once students begin medical school, they feel unsupported in their varied responsibilities
336 towards their families (theme 2b) and additional financial needs (theme 2c), requiring them to
337 make tradeoffs with their education and personal lives (2b.2, 2c.1).

338 *Design Opportunity 2:* Develop flexible systems that can recognize and accommodate students'
339 complex financial needs during medical school.

340

341 *Insight 3:* Students worry about the impact that their medical school debt has on their present and
342 future families, which compounds feelings of guilt and anxiety.

343 *Description:* For students who need to take loans, the decision to pursue a career in medicine is a
344 collective investment with their families. Students feel guilty about the sacrifices their families
345 have to make for the sake of their career (theme 3a) and feel pressure to continue to provide
346 financially for their family while having debt (theme 3b). Students are stressed about acquiring
347 more debt throughout their training (3a.1) and the impact that has on loved ones who are
348 dependent on them (3a.4, 3a.5, 3b.2), especially with respect to ensuring their financial security
349 in the future (3b.4).

350 *Design Opportunity 3:* Create an environment that acknowledges and accounts for the burden of
351 responsibility that students face towards their families.

352

353 *Insight 4:* Without the appropriate education about loans, the stress of debt is exponentially
354 worse.

355 *Description:* Students feel the greatest fear around loans when they do not understand them,
356 including the process of securing loans and paying off debt (theme 4a). Students are
357 overwhelmed by their loan amounts (4a.5) and lack the knowledge or resources to manage their
358 debt (4a.1, 4a.2), making them uncertain about how they will become debt-free in the future
359 (4a.3, 4a.4). Students reported that various resources helped to alleviate those burgeoning fears
360 (theme 4b), including financial aid counselors (4b.2, 4b.3) and physician role models (4b.5, 4b.6)
361 that generally increase knowledge and skills related to debt management (4b.1).

362 *Design Opportunity 4:* Empower students to become experts in managing their debt by making
363 loan-related resources more available and accessible.

364 *Insight 5:* The small, daily expenses are the most burdensome and cause the greatest amount of
365 stress.

366 *Description:* Students with educational debt are mentally unprepared for the burden of managing
367 their daily living expenses (theme 5a), causing them to make significant lifestyle adjustments in
368 the hopes to ease their resulting anxiety (theme 5b). These costs are immediate and tangible,
369 compared to tuition costs which are more distant and require less frequent management (5a.3)
370 Students learn to temper their expectations for living beyond a bare minimum during medical
371 school (5a.1, 5b.2, 5b.4) and develop strategies to ensure that their necessary expenses are as low
372 as possible (5b.1, 5b.2, 5b.3, 5b.4).

373 *Design Opportunity 5:* Develop and distribute resources to support both short- and long-term
374 financial costs for medical students.

375 *Insight 6*: Students view debt as a dark cloud that constrains their mental health and dictates their
376 career trajectory.

377 *Description*: The constant burden of educational debt constrains students' abilities to control
378 their mental health (theme 6a) and pursue their desired career path in medicine (themes 6b & 6c).
379 Students feel controlled by their debt (6a.3) and concerned that it will impact their [ability] to
380 live a personally fulfilling life (6a.1, 6a.2, 6c.6), especially with respect to pursuing their desired
381 medical specialties (6b.1, 6c.3, 6c.5, 6c.6). Students with scholarships, as opposed to loans, felt
382 more able to choose specialties that prioritized their values rather than their finances (6c.1, 6c.2),
383 an affordance that impacts long-term career growth and satisfaction.

384 *Design Opportunity 6*: Create a culture of confidence for managing debt and debt-stress among
385 medical students.

386 **Discussion**

387 This is the first multi-institutional national study to explore the impact of debt-related
388 stress on medical students' well-being in the United States. We used an innovative, mixed
389 methods approach to better understand the factors that significantly affect debt-related stress, and
390 propose opportunities for improving medical student well-being.

391 **URM Students**

392 Analysis of survey results found that students who identify as URM are more likely to
393 experience higher levels of debt-related stress than non-URM students. Our study also found that
394 among all higher debt burden categories, debt levels were higher for URM students, findings

395 consistent with studies that have shown the disproportionate burden of debt among URM
396 students.¹ Our semi-structured interviews illuminated that students from low-income
397 backgrounds feel unsupported by their medical schools in these varied financial stressors that
398 extend beyond tuition costs (insight 2), leaving their needs unmet and increasing financial stress
399 over time: *“We don’t have different socio-economic classes in medicine because there’s
400 constantly a cost that [isn’t] even factored into tuition cost [and] that we can’t take student loans
401 for.”* Many URM students feel especially stressed by their financial obligations towards their
402 families (insight 3), and describe the decision to enter into medicine as one that is collective
403 (*“the family’s going to school”*) rather than individual, placing additional pressure on themselves
404 to succeed in their career: *“Being of low SES, the most significant stressor for me is the financing
405 of medical school and the pull of responsibility for my family.”* Several other studies from the
406 literature confirm that students who identify as URM and first generation college or medical
407 students are at higher risk for financial stress compared to their counterparts,⁷ and report that
408 they feel as though it is their responsibility to honor their families through their educational and
409 career pursuits.²³ Our study demonstrates and describes how low-income and URM students
410 face numerous financial barriers in medical school, resulting in medical trainees that are less
411 diverse than the patient populations they are serving.^{1,8}

412 **Debt Amount**

413 Our quantitative analysis found that students with debt amounts over \$100,000 are at
414 much higher risk for experiencing severe stress than students with debt less than that amount.
415 Although this finding may seem intuitive, it is important to highlight the degree to which this

416 risk differs between these two cohorts. Students with debt amounts between \$20,000 and
417 \$100,000 are approximately 5 times more likely to experience high stress than students with debt
418 less than \$20,000, while students with debt amounts over \$100,000 are approximately 13 times
419 more likely to experience severe stress when compared to the same cohort. Interview participants
420 describe that the more debt they have, the less hopeful they feel towards achieving financial
421 security (insight 1): *“There are other healthcare professionals that will not accrue the same*
422 *amount of loans that we will, and then may or may not have the same salary or privileges [...]*
423 *makes me question, did I do the right thing?”* Students internalize this rising stress so as not to
424 shift the feelings of guilt onto their families (insight 3), thereby compounding the psychological
425 burden associated with large amounts of debt (insight 6): *“As long as you’re in debt, you’re*
426 *owned by someone or something and the sooner you can get out of it, the better; the sooner I can*
427 *get started with my life.”*

428 **Pre-Clinical Students**

429 According to our survey analysis, students who are in their pre-clinical years are at higher
430 risk for stress than students in their clinical years. Our interview findings from insight 4 suggest
431 that students feel initially overwhelmed and unsure about what questions to ask (*“One of my*
432 *fears is that I don’t know what I don’t know”*) or how to manage their loans so that it doesn’t
433 have a permanent impact on their lives: *“The biggest worry is, what if [the debt] becomes so*
434 *large that I am never able to pay it off and it ends up ruining me financially.”* Pre-clinical
435 students may therefore feel unsure or ill-equipped to manage their loans, making them feel
436 overwhelmed by the initial stimulus of debt. By the time students reach their clinical years, they

437 may have had time to develop strategies for managing stress, acquire more financial knowledge,
438 and/or normalize the idea of having debt.

439 **Medical School Characteristics**

440 Our survey analysis found several risk factors related to medical school characteristics.
441 First, we found that students who attended a private school were at higher risk for debt-related
442 stress than students who attended a public school. Not only is the median 4-year cost of
443 attendance in 2023 was almost \$100,000 higher in private compared to public medical schools,²⁴
444 but it is also the case that financial aid packages are more liberally available for public schools
445 due to state government funding.²⁵ This not only relieves students from having higher amounts of
446 debt, but it also creates a more inclusive cohort of medical students. Insight 2 from our
447 interviews reveal that private medical schools without the infrastructure that can adapt to
448 students' varying needs (e.g. financial aid vs loans).

449 Another characteristic that was found to be a risk factor for debt stress was attending a
450 medical school on the West Coast (compared to a non-coastal school.) This was a surprising
451 finding given that tuition rates for both private and public schools on the West Coast are no
452 higher than those in other regions.¹⁷ The distribution of survey respondents did not vary
453 significantly across regional categories, so no bias in sample size is suspected. A potential
454 explanation might be that historically, students match for residency programs that are in their
455 home state or not far from their home state.^{26, 27} Students may prefer to settle on the West Coast,
456 and may be willing to take on more financial debt in pursuit of their long-term practice and
457 lifestyle goals.

458 **Gap Year**

459 Our quantitative analysis found that students who reported having considered taking a
460 leave of absence for well-being purposes were at higher risk for debt-related stress. This cohort
461 of students likely experience higher levels of stress as they are conscious of the negative impact
462 it has on their life, and have already ruminated on leaving medical school. A study by Fallar et
463 al. found that the period leading up to a leave of absence is particularly stressful for students
464 because they are unfamiliar with the logistics of taking time off, and don't feel as though leaving
465 medical school is encouraged or normalized for students.²⁸ An interview with a student who did a
466 joint MD and PhD program expressed having more time for herself during her PhD program, and
467 described using money for activities that could alleviate stress (*"I took figure skating during my*
468 *PhD"*) rather than create more stress by compromising on their lifestyle during medical school
469 (insight 5). More research may be needed to better understand and support students considering
470 taking a leave of absence from medical school.

471 **Specialty Choice**

472 Our study found that students with high debt stress pursue moderately competitive
473 specialties compared to students with low debt stress. This may be explained by the fact that low
474 debt stress gives students the freedom to pursue minimally competitive specialties, which may be
475 more fulfilling to them but typically have lower salaries. Insight 6 further elaborates upon this
476 finding that students with high debt stress deprioritize specialties for which they are passionate in
477 favor of higher paying specialties that might alleviate their debt: *"I love working with kids...but*
478 *being an outpatient pediatrician just wasn't going to be enough to justify the [private school] price*

479 *tag.*” Students with lower debt stress describe having the freedom to choose specialties that align
480 with their values, regardless of anticipated salary: “*Scholarships give me the freedom to do*
481 *[specialties] that maybe are a little bit less well-paying in medicine.*” Interestingly, certain
482 studies examining the relationship between specialty choice and debt stress have found that high
483 debt stress is associated with a higher likelihood of pursuing a more competitive, and presumably
484 higher paying, specialty.⁵ More research investigating the relationship between debt stress and
485 specialty choice could illuminate opportunities for increasing a sense of agency and overall
486 satisfaction among students for their career choices.

487 **Resource Utilization**

488 In our exploration of potential protective factors against the effects of debt-related stress,
489 our survey analysis found that the two variables measured (high mental health resource
490 utilization and meeting with a counselor) did not have any impact on reducing debt-related
491 stress. This finding is inconsistent with the literature, which considers these activities to promote
492 general well-being among students but has never been studied in the context of debt-related
493 stress.¹³⁻¹⁵ A potential explanation is that the survey questions that assessed these activities were
494 imperfect. For example, the question of meeting with a counselor was not a standalone question,
495 but instead, was at the bottom of a list of other wellbeing activities; therefore, students may have
496 been fatigued by the time they got to the bottom of the list and not selected it. Additionally, our
497 definition of “high” mental health resource utilization may have been perceived as too strict (i.e.:
498 80-100%) and perhaps we would have seen effects at lower percentages of utilization (i.e.: 40-
499 60%). Despite this finding, students describe in their interviews that having access to certain

500 resources such as financial knowledge and physician role models can help to alleviate stress by
501 helping them feel confident in managing their loans in the immediate and more distant future
502 (insight 4): *“I’ve had explicit discussions with physicians who went to med school, had debt,
503 paid it off [...] the debt hasn’t hindered their life in any way. I think that just makes me feel a lot
504 calmer.”* This finding aligns with previous studies that suggest that financial knowledge, such as
505 knowledge about loans and a payoff plan, confers confidence in students’ financial
506 management.^{11,12} These factors are also aligned with previous studies that suggest financial
507 optimism, such as with a physician role model who successfully paid off loans, are associated
508 with less financial stress.¹⁰

509 **Next Steps**

510 Our quantitative analysis of risk factors helped us to identify which areas might
511 significantly impact debt-related stress among medical students, while our qualitative analysis
512 provided more in-depth insight into those risk factors for more human-centered intervention
513 design. The HCD process not only provides additional context from the perspective of medical
514 students, but also proposes distinct design opportunities upon which interventions may be
515 designed and tested. The six design opportunities outlined in this paper span distinct areas of
516 impact across the ecosystem, and support the co-design of solutions with students and key
517 stakeholders. Next steps for this project are to build from the design opportunities to conduct
518 structured brainstorming sessions with a diverse cross-section of stakeholders. In HCD
519 brainstorms, design opportunities are framed as “How Might We?” (HMW) questions, which
520 serve as brainstorming prompts and encourage a breadth of different ideas within a well-defined

521 topic. For example, the design opportunity in insight 2 might be reframed as: “HMW develop the
522 adaptive infrastructure necessary to recognize and accommodate students’ complex financial
523 needs?” While existing solutions may be appropriate – such as providing affordable MCAT
524 preparation or subsidized application fees – creative brainstorming can produce novel and
525 innovative solutions that may not otherwise exist. Solution concepts are then selected for
526 iterative prototyping and evaluation with stakeholders, and are continuously refined and
527 modified until the prototype reaches desirability and feasibility targets.

528 **Limitations**

529 Our study had some notable limitations. One potential limitation is that our data
530 collection occurred between 2019-2021 for this publication in 2023. Additionally, as described in
531 the original study,³ a limitation of the MSWS is the inability to determine a response rate of
532 students due to the survey distribution by medical student liaisons from each medical school;
533 under the reasonable assumption that the survey was distributed to every US allopathic medical
534 student, the response rate was estimated to have been 8.7%.³ An additional limitation is the
535 potential for response bias.³ A limitation of the qualitative interviews is the potential for response
536 bias among the interviewees. Although we purposely sampled, the students who accepted the
537 invitation to interview may have been students with extreme views, either very negative views of
538 debt or very neutral views of debt. Additionally, the interviewees were not representative of all
539 possible financial situations, given that most students were from private schools, which typically
540 have higher tuition rates. Also, all students had debt amounts in the middle and high categories,
541 with none in the low category. Finally, our model of risk factors for debt-related stress suggested

542 the presence of negative confounding factors, which exerted effects on specific variables (i.e.:
543 pre-clinical year, West Coast) for which univariate analysis found no significant associations but
544 multivariate analysis did. We did not perform further analysis to identify which variables served
545 as the negative confounding variables.

546 In conclusion, our mixed methods, cross-sectional study exploring debt-related stress and
547 its impact on US medical students' wellbeing and professional development revealed a set of risk
548 factors and design opportunities for intervention. By using a combined quantitative and
549 qualitative HCD approach, we were able to develop a broad, in-depth understanding of the
550 challenges and opportunities facing medical students with education debt. With these efforts to
551 support the well-being and academic success of students at higher risk of debt-related stress,
552 medical education institutions can develop and nurture a more diverse medical field that can best
553 support the needs of future patients.

554
