19

1 **Abstract**

2 It is estimated that ChatGPT is already widely used in academic paper writing. This study
3 aims to investigate whether the usage of specific terminologies has increased, focusing on
4 words and phrases frequently reported as overused by ChatGPT. The list of 118 potentially
5 AI-influenced terms was curated based on posts and comments from anonymous ChatGPT
6 users, and 75 common academic phrases were used as controls. PubMed records from 2000
7 to 2024 (until April) were analyzed to track the frequency of these terms. Usage trends were
8 normalized using a modified Z-score transformation. A linear mixed-effects model was used
9 to compare the usage of potentially AI-influenced terms to common academic phrases over
10 time. A total of 26,403,493 PubMed records were investigated. Among the potentially AI-
11 influenced terms, 75 displayed a meaningful increase (modified Z-score ≥ 3.5) in usage in
12 2024. The linear mixed-effects model showed a significant effect of potentially AI-influenced
13 terms on usage frequency compared to common academic phrases ($p < 0.001$). The usage of
14 potentially AI-influenced terms showed a noticeable increase starting in 2020. This study
15 revealed that certain words and phrases, such as "delve," "underscore," "meticulous," and
16 "commendable," have been used more frequently in medical and biological fields since the
17 introduction of ChatGPT. The usage rate of these words/phrases has been increasing for
18 several years before the release of ChatGPT, suggesting that ChatGPT might have accelerated
19 the popularity of scientific expressions that were already gaining traction. The identified
20 terms in this study can provide valuable insights for both LLM users, educators, and
21 supervisors in these fields.

22

23

1 **Author Summary**

2 Artificial intelligence systems have rapidly integrated into academic writing, particularly in
3 the medical and biological fields. This study investigates changes in the frequency of specific
4 terminologies reported as overused by ChatGPT. By analyzing PubMed records from 2000 to
5 2024, we tracked 118 potentially AI-influenced terms and compared them with 75 common
6 academic phrases. The study's findings reveal that terms such as 'delve,' 'underscore,'
7 'meticulous,' and 'commendable' saw a marked increase in usage in 2024. However, this
8 trend actually began around 2020. This suggests that while some of these terms were
9 already gaining popularity before the release of ChatGPT, the large language model may
10 have accelerated their adoption in scientific literature. Furthermore, the analysis highlights
11 that the impact of ChatGPT extends beyond new terminologies to altering the frequency and
12 style of commonly used academic phrases. Understanding these trends can help researchers
13 and educators see how AI tools are shaping academic writing.

14

1 Introduction

2 ChatGPT rapidly achieved widespread global use after its launch on November 30, 2022.
3 Trained on a vast corpus of text data, the large language model (LLM) including ChatGPT
4 generates natural language with remarkable fluency. Shortly after its release, ChatGPT's
5 applicability for scientific writing in medical and biological fields became evident [1, 2]. Due
6 to the fervor surrounding its capabilities, it was credited as an author on several papers,
7 igniting considerable debate (currently, AI is not acknowledged as an author in scholarly
8 publications [3]). There were even opinions that the use of ChatGPT in paper writing was
9 plagiarism [4], but in reality, LLMs such as ChatGPT, Gemini, and Claude are already being
10 used in paper writing. The use of LLMs can be applied in various ways in academic writing [1,
11 5] and is also important for the research activities of non-native researchers whose first
12 language is not English [6-8]. Presently, a framework has been established that permits the
13 use of LLMs in writing, provided their involvement is adequately acknowledged [3].
14 While LLMs can produce natural writing, their output also exhibits certain characteristics [9,
15 10]. Recently, it became a topic of discussion on X (formerly Twitter) and Reddit that
16 ChatGPT frequently outputs the word 'delve'
17 ([https://www.reddit.com/r/mildlyinfuriating/comments/1bzvgqj/apparently_using_the_wor](https://www.reddit.com/r/mildlyinfuriating/comments/1bzvgqj/apparently_using_the_word_delve_is_a_sign_of_the/)
18 [d_delve_is_a_sign_of_the/](https://www.reddit.com/r/mildlyinfuriating/comments/1bzvgqj/apparently_using_the_word_delve_is_a_sign_of_the/) [Accessed 2024, April 12]). In addition, recent reports focusing
19 on detecting text generated by LLMs have identified several frequently used words, such as
20 'commendable,' 'meticulous,' 'intricate,' and 'realm' [11-14]. The extraction of these
21 characteristic keywords of LLMs in these previous reports was performed by comparing
22 human-generated text with ChatGPT-generated text [11, 13, 14]. While this approach
23 revealed ChatGPT's characteristics among the words commonly used by both humans and
24 ChatGPT, it had methodological limitations in extracting words with low usage frequencies.
25 Clarifying the word expressions that LLMs tend to use in medical and biological papers is
26 crucial for designing academic writing support and medical education programs [15].

1 Moreover, revealing the extent of ChatGPT's impact on papers in the medical and biological
2 fields is essential for maintaining the fairness and reliability of academic research and from
3 the perspective of research ethics [16]. However, the existing literature lacks a thorough
4 investigation of the specific ways in which ChatGPT has transformed academic writing
5 practices in the medical and biological disciplines, necessitating further research.

6 As the usefulness of LLMs becomes more evident, the number of researchers using LLMs for
7 writing papers has been gradually increasing [11, 13, 17]. It would logically follow that there
8 has been an increase in the number of research reports featuring specific expressions
9 unique to LLMs. This study, therefore, tests the hypothesis that the adoption of certain
10 scientific terminologies has risen following the advent of ChatGPT. Focusing on words and
11 phrases frequently reported as used by ChatGPT, I investigated PubMed records from 2000
12 onwards and performed a comparison using phrases commonly used in academia as a
13 control. This analysis aims to empirically explore the influence of LLMs on the lexicon of
14 medical literature.

15

16 **Methods**

17 **Search for Records**

18 Unlike earlier studies [12-14], this research, drawing insights from various anonymous end-
19 users, extracted potentially AI-influenced terms from Reddit, X (formerly Twitter), blogs, and
20 forums, focusing on words and phrases frequently produced by LLMs. The selection of these
21 terms was carried out through a rigorous manual curation process from April 12 to May 24,
22 2024, identifying 118 potentially AI-influenced terms. In addition, as a control group, I used
23 the top 100 collocations identified as characteristic of the academic corpus in a previous
24 study [18]. Phrases that could be searched on PubMed as two consecutive words were
25 included (for example, the collocation "between and" is used in the form of "between A and
26 B," so it was excluded as no records were found when searching for "between and [Text

- 1 Word]). In the end, 75 common academic phrases were chosen for verification in this study.
- 2 The list of these phrases appears in Table 1.

Table 1. Words and phrases examined for usage rates

Potentially AI-influenced terms

Verbs

align, bolster, burgeon, captivate, catalyze, compel, delve, demystify, dive, elevate, elucidate, embark, embrace, employ, encounter, endeavor, enhance, enrich, explore, facilitate, foster, harness, leverage, mitigate, navigate, nuance, optimize, pave, pioneer, resonate, revolutionize, safeguard, shed light, showcase, streamline, underscore, unleash, unlock, unravel, unveil, utilize

Adjectives

aesthetic, commendable, comprehensive, crucial, cutting-edge, disruptive, dynamic, essential, ever-evolving, fresh, groundbreaking, holistic, illustrious, imperative, innovative, invaluable, intricate, keen, meticulous, methodical, multifaceted, notable, noteworthy, overarching, paramount, pivotal, poised, potent, robust, seamless, tailored, transformative, unparalleled, unprecedented, unwavering, valuable, versatile, vibrant, vital

Adverbs

additionally, aptly, effectively, excellently, impressively, ingeniously, moreover, reportedly, scholarly, strategically, ultimately, undoubtedly

Nouns

adventure, beacon, capability, complexity, cornerstone, digital world, driving force, enigma, game-changer, hurdle, interplay, intersection, journey, kaleidoscope, landscape, new era, paradigm shift, prowess, realm, spearhead, state-of-the-art, symphony, synergy, tapestry, testament, treasure trove

Common academic phrases (controls)

according to, are presented, are shown, associated with, association between, based on, between groups, can be, changes in, characterized by, compared to, compared with, consistent with, control group, correlated with, correlation between, current study, data set, decrease in, defined as, defined by, determined by, differences between, due to, effect on, exposure to, follow up, have shown, higher than, in addition, in contrast, increase in, indicate that, interaction between, is consistent, no significant, number of, obtained from, occurrence of, our results, our study, over time, participants were, percentage of, present study, prevalence of, previous studies, related to, relationship between, respect to, results obtained, sample size, show that, significant between, significant difference, significantly different, significantly higher, statistically significant, subset of, suggest that, these findings, these results, this article, this paper, this study, to determine, to evaluate, was calculated, was measured, was performed, was used, were collected, were determined, were significantly, with respect

- 3 I used PubMed's advanced search feature (<https://pubmed.ncbi.nlm.nih.gov/advanced/>) to
- 4 reveal the number of records in which these words were used by searching for "Text Word".
- 5 To ensure comprehensive coverage of verb forms in English, the search query included the
- 6 base form, third person singular present, present participle/progressive, past tense, and past
- 7 participle. For nouns, both singular and plural forms were incorporated. Considering the

1 daily increase in records indexed in PubMed, the search conditions were standardized from
2 January 1, 2000, to April 30, 2024. The search formulas for all words/phrases are shown in
3 S1 Table.

4

5 **Data Preparation**

6 To investigate the usage trends of potentially AI-influenced terms in the PubMed database,
7 we first calculated the usage frequency of each term by dividing the number of records
8 containing the term by the total number of records in PubMed for each year from 2000 to
9 2024 (up to April 30, 2024). This process yielded a dataset with usage frequency for each
10 term and year. Next, the modified Z-score transformation was used to normalize the usage
11 frequency and facilitate comparisons across terms and years. For each term, the median and
12 median absolute deviation (MAD) were calculated. The modified Z-score was computed by
13 subtracting the median from each occurrence rate, dividing the result by the MAD, and
14 multiplying by 0.6745. To identify significant deviations in term usage, we considered an
15 absolute modified Z-score of 3.5 or higher as indicative of a meaningful increase or decrease
16 [19]. The resulting dataset, containing the modified Z-scores for each term and year, was
17 then used for further statistical analysis.

18

19 **Statistical Analysis**

20 A linear mixed-effects model was used to compare the usage of potentially AI-influenced
21 terms and common academic phrases from 2000 to 2024. The data, consisting of modified Z-
22 scores for each word or phrase, were obtained and reshaped into a long format. The model,
23 constructed using the 'lme' function from the 'nlme' package in R, included the modified Z-

1 scores as the dependent variable, the group (potentially AI-influenced terms or common
2 academic phrases) as a fixed effect, and a random intercept for each word or phrase to
3 account for repeated measures. The model's summary was generated to assess the
4 significance of the fixed effect of the group on term usage. A line plot with 95% confidence
5 intervals was created using the 'ggplot2' package to visualize the trends in mean usage for
6 each group from 2000 to 2024. The significance level for all statistical tests was set at 0.05.
7 The analysis was performed using R version 4.3.2.

8

9 **Results**

10 A total of 26,403,493 records between January 1, 2000, and April 30, 2024 were extracted
11 from PubMed. The frequency rates of each word/phrase were determined using the annual
12 total number of records as the denominator, followed by the calculation of the modified Z-
13 score. The Modified Z-score for all the words and phrases across all periods is shown in S2
14 Table.

15 In this study, among the 118 potentially AI-influenced terms verified, 75 words/phrases
16 (listed in descending order: 'delve,' 'underscore,' 'meticulous,' 'commendable,' 'showcase,'
17 'intricate,' 'tapestry,' 'symphony,' 'impressively,' 'realm,' 'cutting-edge,' 'prowess,' 'captivate,'
18 'noteworthy,' 'groundbreaking,' 'unlock,' 'compel,' 'leverage,' 'notable,' 'unveil,' 'ingeniously,'
19 'pivotal,' 'bolster,' 'holistic,' 'safeguards,' 'elevate,' 'unwavering,' 'transformative,' 'pioneer,'
20 'enigma,' 'embark,' 'invaluable,' 'testament,' 'nuance,' 'mitigate,' 'game-changer,' 'valuable,'
21 'endeavor,' 'imperative,' 'crucial,' 'revolutionize,' 'unleash,' 'effectively,' 'employ,' 'digital
22 world,' 'foster,' 'demystified,' 'multifaceted,' 'navigate,' 'unravel,' 'ever-evolving,' 'streamline,'
23 'intersection,' 'utilize,' 'harness,' 'shed light,' 'strategically,' 'seamless,' 'encounter,' 'essential,'
24 'align,' 'additionally,' 'pave,' 'poised,' 'innovative,' 'synergy,' 'comprehensive,' 'burgeon,' 'aptly,'
25 'dive,' 'unparalleled,' 'ultimately,' 'vital,' 'journey,' 'enhance') displayed a modified Z-score

1 exceeding 3.5 in 2024. While the majority of the 75 common academic phrases (controls)
2 displayed no significant deviations in usage rates, phrases such as 'occurrence of,' 'these
3 findings,' 'have shown,' 'interaction between,' and 'characterized by' surpassed a modified Z-
4 score of 3.5 in 2024. On the other hand, the phrases 'percentage of,' 'was measured,'
5 'number of,' 'with respect,' 'respect to,' and 'to determine' registered modified Z-scores
6 below -3.5 in the same year (Fig 1).

7

8 [Insert Fig 1 here]

9 **Fig 1.** Scatter plot of word/phrase usage frequency vs. modified Z-Score in 2024.

10 Fig 1 illustrates the relationship between the frequency of use and the modified Z-scores for
11 words and phrases with absolute modified Z-scores exceeding 3.5 in 2024. Red circles represent
12 potentially AI-influenced terms, while grey circles represent common academic phrases (controls).
13 The x-axis shows the number of total records using the words/phrases on a logarithmic scale, and
14 the y-axis displays the modified Z-score for usage frequency.

15

16 The linear mixed-effects model revealed a significant effect of the group (potentially AI-
17 influenced terms vs. common academic phrases) on the usage frequency. The model
18 showed that the usage of potentially AI-influenced terms was significantly higher than that
19 of common academic phrases ($\beta = 0.552$, $SE = 0.079$, $t(191) = 6.958$, $p < 0.001$). The line plot
20 (Fig 2) illustrates the trends in mean frequency for potentially AI-influenced terms and
21 common academic phrases from 2000 to 2024. While the frequency of the control group
22 remains relatively stable, the potentially AI-influenced terms begin to show an increase
23 around 2016, with a notable and steep upward trajectory starting in 2020 that becomes
24 particularly pronounced in 2023 and 2024.

25

26 [Insert Fig 2 here]

1 **Fig 2.** Mean usage (modified Z-scores) of potentially AI-influenced terms and common
2 academic phrases from 2000 to 2024. Shaded areas represent 95% confidence intervals.

3

4

5 **Discussion**

6 This study demonstrated that, in the fields of medicine and biology, a number of specific
7 words and phrases, led by "delve," "underscore," "meticulous," and "commendable," have
8 come to be used more frequently following the advent of ChatGPT. The increasing trend in
9 the usage rates of these words/phrases was more pronounced in 2024 than in 2023 in
10 almost all cases. This may reflect the generalization of LLM use among researchers in the
11 fields of medicine and biology, as shown in previous findings [13]. The list of overused terms
12 suggested in this study will help those writing with LLMs centered around ChatGPT.

13 It has been observed that medical texts generated by ChatGPT, while fluent and logical, tend
14 to include less specific information and more generalized expressions compared to those
15 authored by humans, which feature a richer and more diverse content [10]. In general
16 papers, it has been noted that ChatGPT tends to 1) use the same style and expressions
17 repeatedly, 2) show a decrease in the frequency of basic verbs like 'is' and 'are,' and 3)
18 frequently use adjectives and adverbs [11]. Particularly for adjectives and adverbs,
19 numerous words that ChatGPT frequently uses have been pointed out [14]. Because this
20 study only counted the records where specific words or phrases occurred, it did not evaluate
21 the weight of terms appearing multiple times. In the current study, several words that were
22 previously identified as frequently used by ChatGPT did not exhibit a notable increase in
23 usage; yet, ChatGPT may actually overuse these words more than suggested by the results of
24 this study. Similarly, frequently used verbs such as 'enhance', 'elevate', and 'utilize' may also
25 have been overused by LLMs more than suggested by this study.

1 A previous reports' limitation lies in their lack of focus on the specific words or terms
2 overused by ChatGPT, thus failing to comprehensively explore characteristic terms. As
3 extensively debated online
4 ([https://www.reddit.com/r/mildlyinfuriating/comments/1bzvgqj/apparently_using_the_wor](https://www.reddit.com/r/mildlyinfuriating/comments/1bzvgqj/apparently_using_the_word_delve_is_a_sign_of_the/)
5 [d_delve_is_a_sign_of_the/](https://www.reddit.com/r/mildlyinfuriating/comments/1bzvgqj/apparently_using_the_word_delve_is_a_sign_of_the/) [Accessed 2024, April 12]), the increased usage of the word
6 'delve' was incredibly pronounced compared to other words or phrases, with a modified Z-
7 score of around 100. Despite its overwhelming presence, previous papers compared texts
8 created by humans and ChatGPT [12-14] did not mention 'delve,' highlighting a strength of
9 this study's methodology. This study cannot conclusively establish the connection between
10 the frequent use of 'delve' and the emergence of ChatGPT, although its impact is highly
11 suspected. The frequent use of the term 'delve' by ChatGPT could be attributed to its
12 prominence in the training data, possibly resulting from common instructions during the
13 reinforcement learning from human feedback phase, or as a feature of large language
14 models designed to project authority; however, these hypotheses remain speculative and
15 unconfirmed.

16 Notably, the frequency of use for the potentially AI-influenced terms investigated in this
17 study had already diverged markedly even before ChatGPT released in November 2022. In
18 particular, 'delve' was used exceptionally often in 2024, but it had also been used at an
19 exceptionally high frequency in academic writing since 2021. One hypothesis arises from this
20 observation—the increasing popularity of these terms in scientific writing may have
21 influenced the output of ChatGPT. Also, ChatGPT's training process might have further
22 reinforced their usage, possibly creating a bidirectional causal relationship. In other words,
23 ChatGPT may have accelerated the inevitable temporal changes in writing in research.
24 However, this hypothesis would be difficult to verify, since we cannot observe a parallel
25 universe where ChatGPT does not exist.

1 Interestingly, some of the common academic phrases used as controls also deviated in their
2 proportion of use in 2024. The four phrases 'occurrence of', 'these findings', 'have shown',
3 and 'interaction between' significantly increased in frequency of use in 2024, but since they
4 are all very commonly used expressions in academic writing, it would be difficult for us
5 humans to recognize that their frequency has increased. Conversely, the six phrases
6 'percentage of', 'was measured', 'number of', 'with respect', 'respect to', and 'to determine'
7 notably decreased in usage in 2024. When interpreting these results, we must remember
8 that the language used in papers naturally evolves over time [20]; many phrases that
9 decreased in frequency had already been declining even before the introduction of ChatGPT.
10 However, the two phrases 'to determine' and 'number of' did not show a noticeable
11 decrease in frequency of use before 2022, and their frequency of use appears to have
12 decreased significantly after 2023 (see S2 Table). While this result may be coincidental, it
13 could also indicate that the proliferation of ChatGPT may subtly lead to the decreased use of
14 certain words or phrases without us recognizing it.

15 This study has some limitations. The most important limitation is that the terms potentially
16 influenced by LLMs in this study were identified through manual inspection rather than
17 being extracted in an objective and systematic manner. Therefore, there may be words or
18 phrases that were not included in this study yet have seen a significant increase in usage
19 post-ChatGPT. Additionally, temporal shifts in the frequency of word or phrase use could
20 have been influenced by external factors such as evolving research trends and shifts in the
21 style of scientific communication, factors not accounted for in this study. Another limitation
22 is the application of the Modified Z-score to the time series data. As each word or phrase
23 has only 25 data points (one for each year from 2000 to 2024), the Modified Z-score, which
24 is primarily designed for detecting outliers, may have limited applicability in this context.
25 The small number of data points also makes it challenging to apply certain statistical
26 methods for trend analysis or to compare the usage frequencies between specific years (e.g.,

1 2023 and 2024). Furthermore, the study may have been influenced by the presence of
2 certain proper nouns. For example, there is a service called "Microsoft Delve." A PubMed
3 search for ("microsoft"[Text Word]) AND ("delve"[Text Word]) yielded only three hits
4 (Accessed 2024, May 24), suggesting that the impact of "Microsoft Delve" on the results is
5 likely to be minimal. However, there remains a possibility that other unforeseen proper
6 nouns could have influenced the usage frequency of some terms. Lastly, the absence of
7 long-term trend analysis limits our ability to fully assess the impact of AI on language usage.
8 Particularly, since the data for 2024 is limited to April, it cannot be denied that the results
9 may fluctuate when looking at the whole year

10

11 **Conclusion**

12 This study highlights the overuse of specific words and phrases that have become more
13 prevalent since the introduction of ChatGPT. The list of selected terms discussed in this
14 study can be advantageous for both users employing LLMs for writing purposes and for
15 individuals in educational and supervisory capacities within the fields of medicine and
16 biology. However, the changes in academic writing suggested by this study may be
17 temporary and specific to 2024; as LLMs improve, distinguishing between human and AI-
18 generated text may become more challenging [21]. Thus, further studies on future changes
19 in academic terminology are warranted. Many researchers are expected to continue using
20 LLMs for their writing—needless to say, adhering to ethical aspects and taking responsibility
21 for the final output is crucial for the authors when using these tools.

22
