## 1 **Abstract**

2 **Objectives:** There is an increasing number of international students in China. Acculturation  
3 strategies are the way students cope with different cultures, including integration, assimilation,  
4 separation, and marginalization. This study aims to investigate the acculturation strategies and  
5 associated factors, and the effect of these strategies on mental health status among international  
6 students in China.

7 **Study design:** Cross-sectional study.

8 **Methods:** Study data were collected from 567 international students attending universities in  
9 China. Acculturation strategies, acculturative stress, depressive symptoms were measured using  
10 reliable and valid scales. Linear and multinomial logistic regression were used for analysis.

11 **Results:** Study findings revealed that integration (31.57%) was the most preferred acculturation  
12 strategy, followed by marginalization (28.92%), separation (21.87%) and assimilation (17.54%).  
13 Females were more likely to choose separation strategy than marginalization, while students with  
14 religions had higher likelihood to choose integration strategy. Students majoring in Literature/Art  
15 and liking their major were more likely to use assimilation strategy. Students with more studying  
16 time in weekdays and medium studying time in weekends were more likely to prefer integration  
17 strategy. Students with separation and integration strategy had higher acculturative stress.

18 **Conclusions:** Integration is the most popular acculturation strategy among international students  
19 in China. Students with separation and integration strategy had worse mental health status.  
20 Gender, major, religion, daily study time were significantly associated with the preference of  
21 acculturation strategies.

22 **Key words:** International students; Acculturation strategies; Acculturative stress; Mental health;

23

## 24 **Introduction**

### 25 **International students in China**

26 With the development of economic globalization, China has attracted a large and increasing  
27 number of international students to study and work. By the end of 2017, there was a total of  
28 489,200 international students from 204 countries studying in China<sup>32</sup>. Studying abroad provides  
29 international students with opportunities to access quality education and expand intercultural  
30 competence<sup>3</sup>. However, adapting to a new cultural, social and educational environment is  
31 challenging and stressful. International students may encounter a lot of challenges, including  
32 language barriers, loneliness, homesickness, and academic failures<sup>4-6</sup>. These difficulties may  
33 increase the risk of developing mental health problems, such as acculturative stress and  
34 depressive symptoms.

### 35 **Acculturation and acculturation strategies**

36 Acculturation is a challenging process of change in values, beliefs, attitudes, and behaviors  
37 when individuals interact with different cultures<sup>7, 8</sup>. Acculturation strategies are the different  
38 coping styles taken by individuals when they live with or contact with two cultures<sup>9</sup>.  
39 Acculturation strategies are developed based on Berry's bi-dimensional acculturation: one is the  
40 identification with the heritage culture, and another is the identification with the host culture.  
41 Thus, four acculturation strategies are generated, including integration, assimilation, separation,

42 and marginalization (Fig 1)<sup>7</sup>. Integration refers to the strategy that individuals maintain the  
43 heritage culture and adopt the host culture simultaneously, while the marginalization strategy  
44 comes true for adopting neither of heritage nor host cultures. Assimilation is the strategy that  
45 people adopt the host culture but reject the heritage culture, while separation is maintaining the  
46 heritage culture but rejecting the host culture. Different acculturation strategies may affect the  
47 process of acculturation for international students<sup>7, 10, 11</sup>.

48 <Insert Figure 1 here>

## 49 **Effect of acculturation strategies on mental health status**

50 Acculturation strategies have been found to be significantly associated with mental health  
51 outcomes, especially acculturative stress and depression<sup>20-22</sup>. For example, one study conducted  
52 among 200 North Indian migrated students in Bangalore city of Karnataka found that students  
53 with separation and marginalization strategies had higher acculturative stress<sup>23</sup>. Another study  
54 among Turkish immigrants in Germany showed that people with integration strategy had the  
55 lowest level of depression, while people with marginalization had the highest<sup>24</sup>. International  
56 students, as a special mobile population, experienced high levels of acculturative stress and  
57 depression<sup>27-30</sup>. However, to our knowledge, few studies have explored the relationships between  
58 acculturation strategies with mental health problems among international students in China.  
59 Therefore, one aim of this study is to investigate the effects of different acculturation strategies  
60 on mental health status.

## 61 **Associated factors of acculturation strategies**

62 An overwhelming empirical studies in acculturation have focused on the effects of different  
63 acculturation strategies on various outcomes<sup>13, 14</sup>. However, limited studies have investigated the  
64 associated factors of acculturation strategies<sup>14, 15</sup>. One study conducted among 210 Turkish  
65 migrants showed that individuals who were young, female and with higher education often  
66 applied a participatory strategy (e.g. integration and assimilation), while those aged 50 or older  
67 and less educated often applied non-participating strategy (e.g. separation and  
68 marginalization)<sup>16</sup>. Another study conducted among 313 immigrant adolescents in Portugal  
69 showed that ethnicity, majority identity, discrimination, experience adaptation, gender, age were  
70 associated with acculturation strategy preference<sup>12</sup>. Other studies also reported that international  
71 students who were married and lived with their spouses may experience sociocultural  
72 segregation because a substantial part of their time was invested in being with their spouses<sup>17, 18</sup>.  
73 Another study conducted among international students in China found that male and longer  
74 residence significantly predicted lower degree of acculturation<sup>19</sup>. However, few studies have  
75 investigated the effect of study-related factors (e.g., major, study time, etc.) on the preference of  
76 acculturation strategies. The main purpose of the study is to investigate the demographic and  
77 study-related factors of acculturation strategies among international students in China.

## 78 **Purpose of the study**

79 The present study aims to (1) investigate the preference of acculturation strategies among  
80 international students in China; (2) examine the associated factors of acculturation strategies; (3)  
81 analyze the associations between acculturation strategies with acculturative stress and  
82 depression. The ultimate goal is to provide data for future effective interventions on mental  
83 health among international students in China.

84

## 85 **Methods**

### 86 **Participants and sampling**

87 Participants in the study were international students who were attending universities in  
88 Wuhan, China with foreign nationality. Wuhan is a university city with 82 colleges and  
89 universities with over 19,000 international students were studying in Wuhan in 2016<sup>33</sup>. Four  
90 largest universities in Wuhan, covering nearly 60% of the total international students, were  
91 selected to recruit participants<sup>34</sup>.

92 Detailed sampling processes were described elsewhere<sup>5, 34</sup>. Briefly, firstly, four universities  
93 were selected from Wuhan, including Wuhan University, Huazhong University of Science and  
94 Technology, Central China Normal University, and Zhongnan University of Economics and  
95 Law. Secondly, in each selected university, classes of international students, the smallest unit for  
96 schooling in China, were randomly selected. All international students in China were grouped  
97 into classes to study Chinese mandarin with approximately 40-50 students per class. All  
98 international students in the selected classes were eligible to participate. The study was  
99 voluntary, and only the students who signed the written informed consent were recruited. A total  
100 of 630 international students were recruited and completed the survey.

### 101 **Data collection**

102 Data were collected through the self-developed International Student Health and Behavior  
103 Survey (ISHBS). The ISHBS is a packet of questionnaires that asked about demographic and

104 study-related information, acculturative stress, acculturation strategies, and depression. Both  
105 English and Chinese versions of the questionnaire were available for participants to choose from.  
106 No significant difference was found between the data collected using Chinese version (n=62) and  
107 English version (n=505)<sup>5</sup>.

108 The survey was conducted in September 1st in 2012 and ended in November 30th. The  
109 survey was implemented in a classroom with a vacant seat placed between two students to ensure  
110 personal privacy and independence. At the end of survey, all participants were asked to put their  
111 questionnaire into an envelope and placed it into a pre-prepared locked box. Data were manually  
112 entered into the computer with Epidata software. Double-entry protocol was used for minimizing  
113 data-entry errors. Among 630 international students, 63 were excluded due to the missing data  
114 for several key variables, yielding 567 (90%) participants in the final sample. The study was  
115 approved by the institutional review board at Wuhan University, China.

## 116 **Measures**

### 117 **Acculturation Strategy**

118 Acculturation strategy was measured using the self-developed Acculturation Strategy  
119 Assessment (ASA) (supplementary Table S1). ASA was developed based on Berry's four  
120 strategies of acculturation<sup>7, 35</sup>, and several developed scales measuring acculturation strategies<sup>7,  
121 36-38</sup>. ASA consists of 30 items assessing two dimensions of acculturation with 15 items for each  
122 dimension. One dimension measures the host culture adaptation, another dimension measures the  
123 self-culture maintenance. A seven-point Likert scale was used to measure the ASA ranging from  
124 1 (strongly disagree) to 7 (strongly agree). Total score for each dimension was computed.  
125 Median score for each dimension was used as cut-off point. Participants scored high on both

126 dimensions were categorized as “Integration”, and participants who scored low on both were  
127 categorized as “Marginalization”. Participants were grouped into “Assimilation” if they scored  
128 high on host culture subscale, and low on self-culture subscale, and participants were grouped  
129 into “Separation” if scored opposite. The Cronbach alpha was 0.87 for total ASA, and 0.86 for  
130 host culture subscale and 0.85 for self-culture subscale.

### 131 **Acculturative Stress**

132 Acculturative stress was measured using the Acculturative Stress Scale for International  
133 Students (ASSIS)<sup>39</sup>. ASSIS is a widely used scale with 36 items, measured using a five-point  
134 Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). In our previous study<sup>5</sup>, we  
135 categorized the ASSIS into seven subscales, including value conflict (VC), identity threat (IT),  
136 opportunity deprivation (OD), mistreated (MT), lack of cultural competence (CC), lack of self-  
137 confidence(CS), and homesickness (HS) based on the item content, item response, exploratory  
138 and confirmative factor analysis. Total score was estimated with higher score indicating greater  
139 level of acculturative stress. The Cronbach alpha was 0.93.

### 140 **Depression**

141 Depression was measured using the 10-item Centers for Epidemiological Studies  
142 Depression Scale (CESD-10)<sup>40</sup>. A four-point Likert scale was used to assess individual items  
143 with 0 (rarely or none of the time, or less than 1 day) to 3 (most of the time or 5–7 days). Two  
144 items were reversely coded, and total scores were computed with higher scores indicating greater  
145 depression. The Cronbach alpha was 0.70.

146 *Demographic variables and covariates*

147 Demographic variables and other covariates in the study included age (in years), gender  
148 (male/female), place of origin (Asia/Africa/others), marital status (unmarried/married/divorced  
149 /separated/others; and was categorized into unmarried/others), education (undergraduate  
150 /graduate), religion (Christian/Muslim/Hinduism or Buddhism/Judaism/ no religion/others),  
151 duration in China (in months; and was categorized into one year or less/more than one year),  
152 major area (sciences/language and art/medicine/business/law/others), if like the major (don't  
153 like/don't know/like), level of preparedness before coming to China (not well/well), number of  
154 roommates (0/1/2/3 or more), study time in weekdays/weekends (0-2 hours/3-4 hours/5-6  
155 hours/> 6 hours).

## 156 **Statistical analysis**

157 Descriptive analyses (e.g., frequency, mean, standard deviation) were used to describe the  
158 sample characteristics. Chi-square analysis was used to compare the frequency of four  
159 acculturation strategies across different covariates. Multinomial logistic regression was used to  
160 investigate the associated factors of four acculturation strategies with marginalization as  
161 reference group. The covariates with p value less than 0.1 in the Chi-square test were included in  
162 the multinomial logistic regression analysis. Linear regression was used to investigate the  
163 associations between acculturation strategies with acculturative stress and depression when  
164 controlling for covariates. All statistical analyses were conducted using SAS version 9.4 (SAS  
165 Institute, Cary, NC, USA).

166

## 167 **Results**

189 =2.61, 95% CI = [1.01, 6.79]), Muslim ( $OR = 4.55$ , 95% CI = [1.65, 12.53]), and  
190 Buddhist/Hindu ( $OR = 3.57$ , 95% CI = [1.20, 10.65]) had higher likelihood to choose integration  
191 strategy. Students majoring in Literature/Art ( $OR = 3.00$ , 95% CI = [1.05, 8.59]) were more likely  
192 to use assimilation strategy, while students who like their own major preferred to utilize  
193 assimilation strategy. Integration strategy was often applied by the students whose daily studying  
194 time were 3-4 hours ( $OR = 2.83$ , 95% CI = [1.28, 6.30]), 5-6 hours ( $OR = 3.65$ , 95% CI = [1.47,  
195 9.08]), >6 hours ( $OR = 3.99$ , 95% CI = [1.70, 9.39]) in weekday and 3-4 hours ( $OR = 1.94$ , 95%  
196 CI = [1.00, 3.79]) in weekend.

197 <Insert Table 3 here>

## 198 **Effects of acculturation strategies on acculturative stress and** 199 **depression**

200 Results in Table 4 show that compared with international students with marginalization  
201 strategy, those with separation ( $\beta = 11.08$ ,  $p < 0.001$ ) and integration ( $\beta = 6.66$ ,  $p < 0.05$ ) had higher  
202 acculturative stress. Individuals with separation strategy were more likely to have higher stress in  
203 homesickness ( $\beta = 3.14$ ,  $p < 0.001$ ), value conflicts ( $\beta = 1.77$ ,  $p < 0.001$ ), mistreat ( $\beta = 1.18$ ,  $p < 0.05$ ),  
204 lack of cultural competence ( $\beta = 1.75$ ,  $p < 0.001$ ) and lack of self-confidence ( $\beta = 1.34$ ,  $p < 0.05$ ),  
205 while students with assimilation had higher value conflicts than marginalization ( $\beta = 1.08$ ,  
206  $p < 0.05$ ), and students with integration had higher homesickness ( $\beta = 1.69$ ,  $p < 0.001$ ), value  
207 conflicts ( $\beta = 1.40$ ,  $p < 0.001$ ) and lack of cultural competence ( $\beta = 1.04$ ,  $p < 0.05$ ).

208 <Insert Table 4 here>

## 209 **Discussion**

210 This study applied Berry's acculturation framework<sup>7,9</sup> to examine acculturation strategies of  
211 international students in China. Four acculturation strategies, including marginalization,  
212 separation, assimilation and integration, were measured. The study investigated the associated  
213 factors of the four strategies and the associations between the four strategies and mental health  
214 status among international students. Findings of the study provided information to understand the  
215 acculturation strategies, and provide evidence in developing future effective interventions on  
216 mental health among international students.

### 217 **Acculturation strategies among international students in China**

218 Our findings reveal that integration was the most popular strategy among international  
219 students, consistent with previous studies in different countries, including China<sup>42</sup>, Japan<sup>43</sup>,  
220 Belgium<sup>15</sup> and the United States<sup>13</sup>. Multicultural society has been gradually forming and played  
221 an important role in choice of integration strategy<sup>15,44,45</sup>. Assimilation was the least preferred  
222 strategy and less than one third of participants abandoned their heritage culture and actively  
223 participated in Chinese culture. One possible explanation was that the development of cultural  
224 values is subtle, and it would be difficult to modify or abandon specific cultures<sup>46</sup>. Another  
225 possible reason was that most international students prefer to return to their home countries after  
226 completing their short-term studies in China. Thus, they are less likely to change their values<sup>15</sup>.  
227 Marginalization and separation were found to be the moderate preferred strategies in our study,  
228 which were in line with the previous studies<sup>43,47</sup>.

### 229 **Acculturation strategies and associated factors**

230 The study investigated the associated factors of the four acculturation strategies, and  
231 identified six significant factors, including gender, religion, major, preference of major, daily  
232 studying time in weekday and weekend. Relative to males, females were more likely to choose  
233 separation strategy. Females tend to build stronger co-national ties, whose primary social  
234 network was the friendships with people from the same home country<sup>15</sup>. More domestic  
235 cultural contacts than international exchanges may lead to higher likelihood of adopting  
236 separation strategy.

237 International students majoring in Literature/Art, liking their own major were more likely to  
238 prefer the strategy of assimilation. Students majoring in Literature/Art had higher aesthetic taste,  
239 imaginative thinking, and historical logic, and were more knowledgeable in history, culture,  
240 politics, society, etc. The skills and knowledge might play important roles in cross-cultural  
241 contacts<sup>48</sup>. In addition, compared with students majoring in Science, Liberal Arts students had  
242 higher intercultural competence, including more intercultural communication, more confidence  
243 in dealing with situational diversities, and more likelihood to show active attitude toward various  
244 cultures<sup>49</sup>. Students majoring in Literature/Art were also often characterized with higher cultural  
245 awareness. They studied Chinese language and cultural arts so as to comprehensively understand  
246 Chinese culture. Therefore, they will actively participate in the culture of China and enjoy the  
247 fun during their limited study time.

248 Students with religions of Christian, Muslim, and Buddhist/Hindu were more likely to  
249 prefer integration strategy than marginalization. China is a multi-religious country with five  
250 major religions, including Buddhism, Taoism, Islam, Catholicism and Christianity<sup>50</sup>. There are  
251 more than 100 million people with religions, more than 85,000 places for religious activities,  
252 and over 3,000 religious groups in China<sup>50</sup>. Laws in China give people the freedom and respect

253 of religious beliefs. International students with various religions could maintain their religion  
254 while simultaneously enjoy the Chinese culture.

255 Findings of the study also show that students with more time on study in weekdays were  
256 more likely to be integrated in both cultures. The students spending more time on study in  
257 weekday may actively participate in the curriculum practice and maintain interactions with  
258 teachers and classmates to improve their academic achievements. Meanwhile, these students may  
259 gather more social support through the social networks developed in the process of learning and  
260 interpersonal communication with Chinese students and local people<sup>51</sup>. Furthermore, it was also  
261 beneficial in improving Chinese language and deepening the understanding of Chinese culture<sup>52</sup>.

## 262 **Effects of acculturation strategies on mental health status**

263 Findings of the study indicate that relative to marginalization strategy, international students  
264 with separation strategy had higher level of acculturative stress, particularly higher in  
265 homesickness, value conflict, mistreated, lack of cultural competence and lack of self-  
266 confidence. It was consistent with previous studies that individuals who separate themselves  
267 from the host culture were more likely to experience a higher level of cultural stress<sup>35</sup>.  
268 Individuals who applied separation strategy tend to perceive greater cultural distance<sup>53</sup>, which in  
269 turn may lead to higher acculturative stress and more homesickness<sup>54, 55</sup>. On the other hand,  
270 findings of the study show that students with integration strategy also had higher level of  
271 acculturative stress and its components, including homesickness, value conflicts and lack of  
272 cultural competence. The results were contrary to previous studies among immigrants that people  
273 with integration strategy had the lowest acculturative stress<sup>4, 7</sup>. The underlying mechanism of the  
274 different results would be complicated. One possible reason was that international students,

275 unlike immigrants, arrived in the host country for a short period of time. Previous studies have  
276 reported that individuals often experience higher acculturative stress in the first two years of  
277 immigration<sup>56, 57</sup>. In this study, 72.31% of international students have lived in China for only one  
278 year or less. During the process of integration, poor language communication and insufficient  
279 cultural integration may trigger different aspects of cultural conflicts, especially value conflicts.  
280 International students often feel homesickness after leaving home<sup>58</sup>, however, homelessness may  
281 also become stressful when the lack of cultural competence and value conflict happened<sup>5, 39</sup>.

## 282 **Limitations**

283 There were limitations in the study. Firstly, it was a cross-sectional study. Longitudinal  
284 studies are needed in the future to examine the causal relationships of international students'  
285 acculturation strategies with mental health. Secondly, the study was conducted with international  
286 students in Wuhan City. Cautions are needed when generalizing the results to the international  
287 students of the whole nation. Thirdly, data of this study were self-reported. Recall bias and social  
288 undesirability could not be ruled out.

## 289 **Conclusions**

290 Integration is the most popular acculturation strategy among international students in  
291 China. Students with separation and integration strategy had worse mental health status. Gender,  
292 major, religion, daily study time were significantly associated with the preference of  
293 acculturation strategies. Finding in the study deepened our understanding of acculturation  
294 strategy among international students in China, and provided evidence for developing future  
295 effective interventions to prevent the mental health in this special population.
