11

12 **Abstract**

13 *Background:* Housing conditions are intrinsically linked to human health, with inadequate
14 housing potentially increasing exposure to environmentally mediated pathogens. Housing
15 interventions that aim to improve housing and reduce environmentally mediated infections, such
16 as finished floors and housing upgrades for vector-borne diseases, remain relatively under-
17 explored as health interventions. This study explored facilitators of and barriers to funding,
18 implementing, and scaling up housing improvements as health interventions to reduce
19 environmentally mediated infectious diseases.

20 *Methods:* Sixteen key informants (KIs) with direct experience in implementing or working
21 within housing interventions and environmentally mediated infectious diseases in low- and
22 middle-income countries were interviewed using a semi-structured interview format. KIs had
23 diverse backgrounds, including academics researching housing interventions, housing policy
24 advisors, and practitioners implementing housing interventions. A thematic analysis approach
25 was used to identify key themes in interview transcripts, highlighting patterns, commonalities,
26 and variations in participants' responses.

27 *Results:* KIs emphasized the multi-dimensional impacts of housing interventions that are
28 intrinsically linked to Sustainable Development Goals (SDGs), including physical and mental
29 health, as well as environmental, social, and economic dimensions. Moreover, a pronounced
30 shortage of funding and financial systems to address housing interventions was highlighted,
31 alongside the urgent need for more rigorous evidence and cost-benefit analyses. Furthermore, the
32 imperative to raise awareness of the significance of housing and the critical importance of strong
33 collaboration across sectors and stakeholders were stressed. Emphasizing the necessity for
34 project-based and context-specific housing policies, the interviews revealed that contextualizing
35 interventions to their specific setting and fostering community involvement are essential for
36 successful implementation and scale-up.

37 *Conclusions:* Housing interventions play a pivotal role in mitigating environmentally mediated
38 diseases. These interventions can complement existing strategies like water, sanitation, and
39 hygiene (WASH) interventions, ensuring comprehensive approaches to healthy housing and
40 sustainable development goals amidst climate change.

41

42 **Key words:** Housing interventions, Environmentally mediated diseases, Qualitative research,
43 Thematic analysis

44 **Background**

45 Housing is a fundamental component of our living environment, providing shelter and space for
46 essential services such as water supply, sanitation, and food preparation facilities [1]. As a
47 determinant of health, improved housing has the potential to save lives, reduce disease, enhance
48 quality of life, alleviate poverty, and contribute to climate change mitigation [2]. Additionally,
49 improved housing can contribute to the achievement of several Sustainable Development Goals
50 (SDGs), such as those addressing safe and affordable housing (11.1), infectious diseases (3.3), as
51 well as non-communicable diseases (3.4) [3].

52 Globally, the United Nations estimates nearly one billion people live in makeshift
53 structures considered inadequate; that number is estimated rise to 3 billion people by 2030 [4].
54 Across 64 emerging economies, researchers estimated that 48% of households lacked
55 construction with durable materials (defined as burnt bricks, tiles, shingles, iron sheets, or
56 polished wood) [4]. Nearly half of sub-Saharan Africa's urban population resided in substandard
57 housing in 2015 [5], and in many countries where national survey data are available, a high
58 prevalence have dirt or sand floors: Guatemala (29.5% in DHS 2014-15); Haiti (33.8% in DHS
59 2016-17); Timor-Leste (51.2% in DHS 2016) [6]. Housing factors that can augment disease risk
60 are defects in 1) building structure, 2) water supply, 3) sanitation, 4) refuse storage and
61 collection, and 5) food storage and preparation; and 6) diseases associated with the geographical
62 location of the housing [1]. Substandard building structures where floors, walls, and roofs are
63 primarily constructed from unfinished materials such as earth, sand, dung, mud, and thatch can
64 facilitate the survival of pathogens in the home and make it more difficult to remove pathogens.
65 Additionally, an unfinished roof or walls allow vectors to enter the home [5]. Thus, housing has

66 a link to environmentally mediated infections, such as malaria, shigellosis, and cholera, which
67 accounted for 40% of the global infectious disease burden in 2015 [7].

68 Housing interventions that aim to reduce environmentally mediated infections are,
69 therefore, a concern of substantial importance to public health. Biomedical and pharmaceutical
70 treatments often do not address environmental pathogen reservoirs and thus may not be able to
71 achieve sustained reductions in transmission disease on their own [7]. While decades of research
72 have investigated effects of water, sanitation, and hygiene (WASH) interventions on
73 environmentally mediated infections [8–13], which are elements of housing, more
74 comprehensive upgrades to housing infrastructure have been relatively unexplored by
75 researchers and program implementers. Most existing evidence on the impact of housing
76 interventions on infectious diseases in low- and middle-income countries can be broadly
77 categorized into two main research areas: finished floors and housing upgrades for vector-borne
78 diseases (Figure 1).

79 A number of observational studies have investigated impacts of replacing dirt floors with
80 finished floors (e.g., wood, cement, or tile) on health. A study that replaced dirt floors with
81 concrete in Mexico in the early 2000s (Piso Firme) found decreased parasitic infestations,
82 diarrhea, anemia, and adult depression, and improved children’s cognitive development, adult
83 quality of life, and adult happiness [14]. A 2023 meta-analysis reported that living in a home
84 with improved floors was associated with 25% lower risk of any enteric or parasitic infection
85 compared to living in a home with unimproved floors [15]. Because all prior studies on this topic
86 have been observational, the authors emphasized the urgent need for rigorous experimental
87 studies [15].

88 A relatively large number of studies have also investigated housing improvements that
89 reduce vector entry into the home in order to reduce malaria [16]. These structural components
90 include but are not limited to, lightweight and durable roofs with partially closed eaves, screened
91 façades and openings, outdoor latrines, raised sleeping areas, and raised homes [16].
92 Additionally, housing upgrades to increase ventilation and airflow can reduce indoor carbon
93 dioxide, which attracts mosquitoes [17], and improve indoor temperature, which may increase
94 use of bed nets [18]. Two meta-analyses from 2021 and 2023 both found that housing
95 interventions offer a significant protection against malaria and dengue [19, 20]. However, the
96 authors highlighted that most studies were observational, with very low to low quality evidence
97 [19, 20].

98 The objective of this study was to explore facilitators of and barriers to funding,
99 implementing, and scaling up housing improvements as health interventions to reduce
100 environmentally mediated infectious diseases in low- and middle-income countries. Specifically,
101 we aimed to 1) analyze the perceived relationship between housing and health among key
102 informants, 2) identify barriers and success factors when implementing housing interventions, 3)
103 describe the funding landscape of housing interventions for health, and 4) describe how
104 successful housing interventions could be scaled-up. We employed a qualitative approach based
105 on in-depth interviews with key informants who had direct experience implementing or working
106 on housing interventions and environmentally mediated infectious diseases in low- and middle-
107 income countries.

108 **Figure 1**

109

110 **Methods**

111 *Recruitment*

112 We selected key informants (KIs) via purposive sampling, including 1) individuals in academic
113 fields involved in researching housing interventions, 2) individuals involved in the development
114 and passing of housing policies, and 3) individuals from non-governmental organizations
115 working on housing improvements. We identified potential interviewees working in urban, peri-
116 urban, and rural contexts through the authors' professional network, web searches, and
117 snowballing technique. Fifty individuals were contacted via e-mail, 28 replied, and 16 completed
118 interviews (Table 1). Participants provided informed consent prior to each respective interview.

119 *Data collection*

120 We conducted interviews via Zoom videoconference that lasted between 18 and 70 minutes,
121 averaging 40 minutes. Based on the participant's roles, two distinct semi-structured interview
122 guides were used, tailored to capture insights from either a researcher/implementer or a policy
123 perspective (Supplementary Material 1). Zoom was used to generate initial transcripts, which
124 were subsequently checked against the audio files for accuracy.

125 *Data analysis*

126 Following transcription, the interview transcripts were uploaded into the qualitative data analysis
127 software NVivo (Version 14). Thematic analysis with an inductive, reflexive, experiential
128 approach was applied to explore diverse experiences and perspectives and identify themes from
129 the data without preconceived categories [21, 22]. The analysis followed a recursive process
130 comprising six overlapping phases: 1) familiarization with the data; 2) systematic generation of
131 open codes which identified and briefly described relevant and interesting segments; 3)

132 generation of initial themes by collating relevant codes; 4) further development and revision of
133 themes 5) final definition and naming of themes; 6) writing the report, incorporating illustrative
134 examples and interpretations.

135 **Table 1**

136 **Results**

137 *Themes*

138 Based on the in-depth interviews, seven themes were identified in the analysis of stakeholder's
139 perspectives on housing interventions. These included: 1) Communicating the multifaceted
140 impacts of housing interventions, 2) Breaking silos and sector-building, 3) Building the evidence
141 on health impacts and cost-effectiveness, 4) The role of governments, private institutions, and
142 communities in scale-up and need for collaboration, 5) Financing challenges and priorities, 6)
143 Policy and regulatory framework, 7) Addressing contextual and operational challenges.

144 *Communicating the multifaceted impacts of housing interventions*

145 Multiple KIs emphasized the wide-ranging effects of housing interventions on health, noting that
146 they extend beyond addressing one single disease. These included vector-borne diseases like
147 malaria and dengue fever, diarrheal diseases, respiratory illnesses, and water-borne diseases like
148 cholera and typhoid fever.

149 KI 2 described how the combination of factors, including recurrent attacks of malaria, diarrhea,
150 and poor nutrition, collectively diminish a child's resilience in a low-income setting, ultimately
151 increasing risk of mortality.

152 *“So, although the final death is due to malaria, if that child was fit and healthy, they’d be*
153 *more resistant, less likely to die from malaria. And that’s true for all the major killer*
154 *diseases. It’s the fact that the child has everything else since it’s born. It’s had a whole*
155 *succession. Because it lives in a dirty environment.”* (KI 2, Researcher)

156 On a similar note, KI 6 highlighted how numerous factors of the built environment can influence
157 the residents’ well-being, including but not limited to temperature, moisture, overheating,
158 lighting, acoustics, and overcrowding.

159 While discussing the health implications of housing interventions, several KIs emphasized their
160 significance in preventing diseases.

161 *“We call healthy housing an architectural vaccine. That’s the way to really do a lot of*
162 *disease prevention.”* (KI 8, Practitioner/Service manager)

163 Multiple interviewees indicated that by enhancing housing conditions, residents experience
164 fewer illnesses, enabling them to pursue their professional, social, and personal goals more
165 effectively. Describing the impacts of replacing dirt floors with finished floors, KI 9 noted:

166 *“We have been able to see people, when you take away one significant worry from their*
167 *life, like housing, they are able to expend the mental, and spiritual, and physiological*
168 *energies towards something else, like improving their education, going after a better job,*
169 *even just child rearing – taking care of their children. The burden on that becomes*
170 *slightly lessened because one of their major needs is now fixed and taken care of.”* (KI 9,
171 Practitioner/Service manager)

172 *“Prevention is always the poor bedfellow of health interventions. People usually want*
173 *nice hospitals and drugs at the local doctors; and of course that’s understandable. But so*

174 *many other problems could be prevented. And so, it's the importance about prevention."*

175 (KI 2, Researcher)

176 Several KIs expressed the view that housing has multi-dimensional impacts, encompassing
177 economic, social, and environmental dimensions, and that housing is linked to several SDGs.

178 *"Housing is one of those things that touches everything. It touches job, it touches climate
179 and touches health. It touches everything."* (KI 8, Practitioner/Service manager)

180 *"When you look at it [the SDGs], and you go through the list asking, 'Can I achieve that
181 without good housing?', then the answer is no."* (KI 13, Policy advisor)

182 Many KIs highlighted the profound mental health impacts of housing, emphasizing factors such
183 as decreased stress levels and depression. KI 13 described how mental health problems are more
184 challenging to cope with in a polluted, noisy environment. Additionally, several KIs indicated
185 that factors like social status, comfort, and pride associated with one's home affect mental health.

186 KIs highlighted numerous environmental factors associated with housing, including the need to
187 construct homes with sustainable materials instead of traditionally used materials with large
188 carbon footprints such as concrete. KI 3 mentioned that the high deforestation in India led to a
189 new law prohibiting the use of wood in buildings. Similarly, KI 11 described how wood is still
190 being used as a traditional fuel source in Lesotho for cooking and warming houses, which is
191 causing harm to the environment.

192 *"It's really obvious that over-dependence on these trees has a negative impact on our
193 environment because they are being over-exploited."* (KI 11, Service manager/Policy
194 advisor)

195 Some KIs indicated that growing concerns about climate change have elevated attention toward
196 housing interventions, particularly climate-resilient housing. KI 13 commented that the impacts
197 of climate change, including the higher frequency of natural disasters, floods, and heavy winds,
198 amplify awareness of policy makers regarding the interconnectedness between housing and
199 health. On a similar note, KI 14 observed that decision-makers tend to pay more attention to
200 housing when risks become more palpable. Even countries not directly impacted by a natural
201 disaster, as described by KI 15, are spurred to action to improve housing by global disasters like
202 earthquakes.

203 Multiple KIs underscored the persistent need for heightened awareness of housing, which
204 receives less attention than other topics, such as climate change. KIs deliberated on effective
205 strategies to disseminate the importance of their work and the critical role of housing in
206 addressing health disparities.

207 *“I feel very strongly that the dissemination, or the communication effort of what we do is*
208 *almost as important as the implementation work. Because if we get the message out to*
209 *more people how to do this work, [...] I think we can start to get more impactful benefit*
210 *for more people.”* (KI 10, Service manager)

211 Multiple KIs pointed out to the significant opportunity within the housing sector due to
212 anticipated population growth in coming years. They highlighted the potential to build
213 sustainable houses from the ground up.

214 *“For example, in sub-Saharan Africa, the population will increase by 1.2 billion people.*
215 *So, that’s like the current population of China or India adding to the continent. They will*

216 *build houses. Whatever you do. And you can build efficient houses off from scratch,*
217 *which is great.” (KI 2, Researcher)*

218 *Breaking silos and sector-building*

219 Several KIs highlighted a prevailing lack of recognition among individuals and sectors regarding
220 the critical link between housing and health. For example, KI 3 pointed out that malaria research
221 has predominantly been driven by biologists, who have typically neglected the significance of
222 housing.

223 *“I don’t think many health professionals are kind of thinking in that way, how the urban*
224 *fabric for instance is really important for the health of the population.” (KI 3,*
225 *Researcher)*

226 KI 13 illustrated how ministers of education often do not see the connection between children’s
227 educational success and their living conditions. Moreover, KI 13 stated a similar challenge in the
228 case of the ministry of health, saying:

229 *“You know, you can have a lot of gastro-intestinal diseases, respiratory diseases. And all*
230 *takes place at the home because the house has mold, or you have a dirt floor, or you*
231 *don’t have toilets. Or you know, the chickens are walking around your house where your*
232 *kids play.” (KI 13, Policy advisor)*

233 On a similar note, KI 14 suggested that architects and engineers should be educated differently,
234 considering health factors when building a house. Likewise, KI 2 noted that architects, engineers,
235 and city planners may possess a limited understanding of mosquitoes and the diseases they
236 transmit and underscored the necessity for health considerations to transcend the boundaries of
237 health departments, which traditionally addressed such matters in isolation:

238 *“This is a multi-sectoral response that’s required. [...] What we’ve got to do here is*
239 *break across silos. There are huge opportunities for changing things.”* (KI 2, Researcher)

240 KI 7 articulated that a challenge for housing is that it does not fit squarely within a specific
241 sector, like energy or health.

242 *“I think that’s the issue, that this kind of work doesn’t sit anywhere and there’s no clear*
243 *place for it. So that sector-building work needs to be done.”* (KI 7, Researcher)

244 *Building the evidence base on health impacts and cost-effectiveness*

245 Numerous KIs underscored the ongoing need for further evidence on the impacts of housing
246 interventions on health, both for securing funding and effectively scaling up housing
247 improvements. Talking about the scarcity of direct evidence of health impacts, KI 6 noted that
248 research needs to focus on:

249 *“Understanding in which ways buildings affect health, but it’s also about developing the*
250 *methodology to assess. Because how do I know that this room for example is affecting*
251 *me? So, it’s trying to understand the criteria to assess buildings.”* (KI 6, Researcher)

252 KIs consistently emphasized the critical role of a comprehensive cost-benefit analysis; for
253 example, KI 5 noted that cost-benefit analyses are needed to determine which housing
254 modifications are most effective for specific diseases.

255 Multiple respondents indicated multiple factors that should be considered when measuring cost-
256 effectiveness. For example, several KIs noted that households would have fewer repairs (i.e.
257 lowering operation and maintenance costs) if construction was done with more durable materials.

258 *“So, by creating a better home, which you can have for the next 30 years, you increase*
259 *the welfare of people. And I mean, that also has to be kind of factored in if you want to*
260 *assess the benefits of new housing.”* (KI 1, Researcher)

261 Moreover, KI 1 highlighted the importance of successfully showing housing’s impacts on
262 multiple health aspects to justify the cost of housing interventions. KI 4 pointed out that housing
263 improvements often benefit all household members, and KI 2 stressed that housing interventions
264 can protect people with decades; both of these factors will generally increase their cost-
265 effectiveness relative to individual-based interventions.

266 KI 14 emphasized that by improving housing conditions, expenses on other things, such as
267 treatment and medications would likely decrease.

268 *“So, if you can have a secure housing, or a core housing, then even your payments in*
269 *health are going to be reduced, because you are not going to get sick as often.”* (KI 14,
270 Policy advisor)

271 Similarly, KI 5 noted, that:

272 *“If you look at the cost [of the screening intervention] versus the cost that a household*
273 *would also spend in managing malaria, it is still cheaper [...] It’s just the lower cost*
274 *doing the modification then spending \$75 for example in a year to treat malaria – if the*
275 *children don’t die anyway. Because there’s also the element of death. If you factor in*
276 *death that you could also suffer as a family as a real cost of not doing the modification.”*
277 (KI 5, Researcher)

278 KI 10 acknowledged that housing interventions can be extremely expensive and not as cost-
279 effective as certain pharmaceutical interventions.

280 *“Even when we’re talking about cost-effective household improvements, you can’t get*
281 *down, as you’re not talking about a dollar vaccine kind of thing. You’re really at a higher*
282 *rate and so even if they’re longer-term, it just ends up being an expensive intervention*
283 *and therefore a proper study ends up being a bulky budget.”* (KI 10, Service manager)

284 In discussing its role in the policy-decision process, KI 16 emphasized the importance of
285 evidence in the policy making process, even if it is not the only relevant factor, saying:

286 *“I think these studies [on housing and health] have definitely helped put in-situ*
287 *upgrading on the radar of governments, nonprofits, multilaterals, as interventions that*
288 *may do more to improve human welfare than just improving living conditions. That these*
289 *can actually have positive effects on human development indicators.”* (KI 16, Policy
290 advisor)

291 *The role of government, private institutions, and communities in scale-up and need for*
292 *collaboration*

293 A recurring question became whether a top-down or a bottom-up approach is most effective in
294 scaling up housing improvements. Several KIs underscored the critical role of government
295 involvement in effectively scaling up housing interventions.

296 *“Housing programs need to have the national government, the federal government*
297 *behind. Because it’s only the government level that has the fiscal instruments to do it.”*
298 (KI 12, Policy advisor)

299 *“We think that the only way this is scalable is if we work with governments, because they*
300 *are the ones that are mandated by the constitution to provide dignified housing for all.”*
301 (KI 15, Policy advisor)

302 KI 16 highlighted that in the case of the Piso Firme project, the initial drive for the study
303 evaluation came from the Mexican government, which was interested in generating evidence for
304 Piso Firme as a potential low-cost scalable model.

305 *“These were high-level Mexican policy makers looking at the evidence, looking at the*
306 *cost-effectiveness and making policy decisions on where to allocate their social budget*
307 *for housing. [...] Piso Firme was able to scale because there was a large government*
308 *behind it.” (KI 16, Policy advisor)*

309 KI 3 expressed a critical view regarding extensive government involvement in the scale-up
310 approach, stating:

311 *“I would not be too keen on going with the big governmental institutions. [...] I don’t*
312 *think it’s solved by institution. I think, a lot of it is solved by private investment, combined*
313 *with good planning and good support from the government. [...] But when the*
314 *government starts to build, or big institutions start to build, it always goes wrong. It*
315 *needs to be something in between.” (KI 3, Researcher)*

316 KI 9 outlined a strategy focused on prioritizing assistance to those in need and emphasized the
317 significance of fostering community connections to achieve sustainable long-term and replicable
318 outcomes.

319 *“It wasn’t necessarily about institutions. We obviously want to tackle the institutional*
320 *disparities, but it wasn’t about starting at the top. It was more about starting at the*
321 *grassroots, where we can find people who are connected to those larger institutions but*
322 *who are the ones doing the work, who are the ones that are going to be able to actually*
323 *implement these processes.” (KI 9, Practitioner/Service manager)*

324 Several KIs discussed how a government’s political orientation influences its housing agenda
325 and resource distribution. KI 12 delineated how a transition from a right-wing to a left-wing
326 government precipitated a change in the nation’s housing policy. Similarly, KI 13 noted:

327 *“So, when you have a transition [...] of government [...] the allocation of housing and*
328 *the type of work you do becomes completely different.”* (KI 13, Policy advisor)

329 Considering the dynamic nature of political landscapes and the brevity of legislative tenures, KI
330 2 underscored the need for strategies resilient to political fluctuations.

331 *“So, what we’re talking about is long-term strategies that are supported irrespective of*
332 *the political color of local politicians.”* (KI 2, Researcher)

333 Several KIs recognized the significant influence of the private sector in driving the direction of
334 housing scale-up. For instance, KI 15 emphasized the pivotal role of the chamber of commerce
335 in the construction sector as a major policy driver in Colombia. On a similar note, KI 12
336 observed:

337 *“I mean the private sector has a very important role. Of course you need to be careful.*
338 *[...] That you [don’t] have housing policies that are led by the private sector completely,*
339 *that only serve their interest. It happens quite often in many countries.”* (KI 12, Policy
340 advisor).

341 The importance of community involvement, as emphasized by several KIs, lies in its role in
342 facilitating the understanding of community perspectives on housing conditions, securing
343 willingness to implement housing interventions, and establishing project-based policies.

344 *“You need to get the community involved, the people whose lives you are trying to*
345 *improve. To ask them about and explain [to] them what the issues are and to see their*
346 *initiatives for improving it.” (KI 2, Researcher)*

347 Several KIs delineated the consequences of insufficient community involvement in health
348 interventions, noting disparities in perceived priorities between communities and other
349 stakeholders. KIs provided examples of when health interventions have been repurposed by
350 communities for more immediate priorities, such as using bed nets for fishing (KI 5),
351 safeguarding poultry, and protecting crops from insects (KI 6).

352 In discussing the disparity between public stakeholders or government finance sectors and the
353 communities, KI 7 emphasized that while governments tend to prioritize disease indicators,
354 communities often have numerous other housing-related considerations that hold greater
355 importance to them.

356 *“What the biggest burden of disease is [...] doesn't capture the lived experience of*
357 *somebody living in a poor-quality house which might have many more impacts in terms*
358 *of the house. The time and energy it takes to deal with a problematic [...] house is not*
359 *considered.” (KI 7, Researcher)*

360

361 Numerous KIs stressed the importance of extensive stakeholder collaboration and local capacity
362 building to ensure the effective scale-up of housing improvements.

363 *“It's not only like, ‘okay, because we already changed the policy, things are going to*
364 *happen just like that’. You also need to have like that cycle and that pipelining, which you*
365 *can also change, or improve technical competencies at the local level. So, I think our*

366 *challenge is how can you make a pipeline in order to transfer knowledge [about how to*
367 *build correctly] to all parts of the value chain. And also, how can we learn from it.” (KI*
368 *14, Policy advisor)*

369 *“And then we need to have people all the way down to like the grassroots level and*
370 *people who are really doing implementation on the ground, and we need to have like*
371 *everybody in between. We need to have researchers, we need to have practitioners,*
372 *everybody involved so that I think we can really make some progress on this.” (KI 10,*
373 *Service manager)*

374 KI 13 underscored the potential risk of uneven stakeholder influence, emphasizing the
375 imperative of leading them to a unified mission to guide collective progress.

376 *Financing challenges and priorities*

377 While KIs noted diverse financing options for housing interventions, including government
378 funding, mortgages, and private sector investment, they consistently highlighted inadequate
379 financing systems and funding as a major obstacle to implementing and scaling up housing
380 interventions. KIs noted that there is a preference to fund disease-specific, pharmaceutical
381 interventions over broader housing interventions, possibly due to limited evidence on housing
382 interventions and higher cost.

383 KI 10 noted a common response from potential funders, expressing skepticism about housing as
384 a proven health intervention. A dilemma arising from the scarcity of existing evidence and lack
385 of interest in supporting the generation of new evidence was described by KI 7:

386 *“I think it’s a bit chicken and egg, like there’s no data on it but then there’s nobody*
387 *collecting the data that we need and therefore it’s not getting the exposure, or the focus.”*

388 (KI 7, Researcher)

389 KI 9 highlighted a tension in the funding landscape, noting that smaller funders often prioritize
390 seeing direct impact over rigorous research. In comparison, bigger funders demand more
391 stringent evidence evaluation but do not prioritize and focus on housing.

392 Several KIs mentioned that housing is competing for budget and resources with other sectors and
393 stakeholders, posing another challenge in financing housing improvements. Discussing the
394 reluctance of some governments to invest in housing interventions, KI 12 noted that this is:

395 *“Either because they don’t want to raise taxes, or they don’t want to cut expenditures in*
396 *other sectors to just spend in modern housing.”* (KI 12, Policy advisor)

397 Similarly, KI 9 noted that housing sometimes is:

398 *“Competing for space, competing for solutions between NGOs and between those who*
399 *are actually trying to do good work.”* (KI 9, Practitioner/Service manager)

400 *Policy and regulatory framework*

401 Multiple KIs highlighted the pivotal role of policy in enabling the sustainable and efficient
402 scaling up of housing interventions, as they dictate the manner of construction while also
403 regulating and standardizing the process. According to KIs, promoting social justice and human
404 rights within housing policies and constitutions is another cornerstone of the regulatory
405 framework. Using an example involving screening windows and doors, KI 2 discussed the role
406 of policies in housing interventions:

407 *“You could shape the buildings of the future by having local bylaws, or enacting bylaws*
408 *which say that all houses should be screened. You could reduce tax on importation of*
409 *screening [to]encourage house screening.” (KI 2, Researcher)*

410 *“So, if you could make local zoning rules and building codes that are actually*
411 *reasonable, that would be good.” (KI 3, Researcher)*

412 KI 12 stressed that the existence of housing policies does not guarantee improved housing
413 conditions.

414 *“We’re seeing a lot of countries that have policies and no implementation because it is*
415 *just like a piece of paper.” (KI 12, Policy advisor)*

416 Several KIs highlighted that poorly or inadequately formulated policies can impede the delivery
417 of healthy housing solutions. They observed that housing policies in several countries contain
418 blind spots because they tend to over-emphasize economic factors, and they are often
419 disconnected from the communities or those implementing housing improvements. KI 13 stated:

420 *“If I am a minister of housing that focuses on economic growth, I can be very convincing*
421 *and I can structure all my products around that. But there is a huge price for the*
422 *vulnerable families.” (KI 13, Policy advisor)*

423 *“I think there’s a real gap between people who are writing policy and people who are*
424 *implementing the work and getting action done.” (KI 10, Service manager)*

425 Another aspect discussed by KIs is the issue of housing ownership, which adds to the complexity
426 of the regulatory framework. KI 7 described that, unlike the public nature of the healthcare
427 system, housing operates within a complex private market with various ownership models,

428 posing difficulties to widespread interventions. Discussing the likelihood of housing
429 interventions being scaled up, KI 7 noted:

430 *“In a situation where you have public ownership of housing and social housing, and you*
431 *have more involvement from the state, then it’s probably more likely. But when you have*
432 *very privatized markets, where land is really expensive, when housing itself is a*
433 *commodity, [...] then it becomes quite difficult.” (KI 7, Researcher)*

434 *Addressing contextual and operational challenges*

435 Multiple respondents pointed out that a lack of skills and knowledge among local populations
436 hinders the implementation and scaling-up of housing improvements. This can result in poor
437 quality of construction and unsafe buildings. KI 8 noted:

438 *“The labor market doesn’t exist really to very easily train a bunch of masons. So, we*
439 *need a whole apprenticeship program.” (KI 8, Practitioner/Service manager)*

440 In discussions on operational challenges, KIs emphasized considerable logistics and costs of
441 transporting construction materials to some areas. Additionally, they noted the lack of supply
442 chain and distribution networks as further obstacles.

443 *“Then another market failure is on supply chain. [...] there’s no FedEx here, there’s not*
444 *like a UPS. Like, every person has to create their own last-mile distribution network. And*
445 *that is very expensive.” (KI 8, Practitioner/Service manager)*

446 KI 3 highlighted the low degree of industrial manufacturing in some countries and how the need
447 for manual labor to build homes by hand dramatically raises costs and reduces the scaling up of
448 improved housing.

449 *“I mean, the success of a house in our parts of the world [high income settings] is*
450 *because it’s highly industrial today and you can build very efficient and also very good.”*

451 (KI 3, Researcher)

452 Multiple interviewees emphasized the necessity of considering contextual factors specific to each
453 region or community when implementing or scaling up housing policies and interventions, as the
454 materials, climate, and cultural norms and practices vary across different geographical areas.

455 *“So, what kind of environment? What kind of people? How do they live their lives? You,*
456 *know, it’s important because you will not take the same interventions everywhere.”* (KI 5,

457 Researcher)

458 *“I would go with that context-specific approach where I would say, before allocating*
459 *resources, I would do my groundwork and say, ‘which is the biggest challenge in this*
460 *particular region?’”* (KI 4, Researcher)

461 According to KI 9, a consequence of not correctly adjusting programs to their context is that
462 solutions and interventions have become very templated, where people rely on what worked in
463 the past and try to apply it in the same manner in another context.

464 *“Just because it’s the same problem doesn’t necessarily mean that it necessitates the*
465 *same solution.”* (KI 9, Practitioner/Service manager)

466

467 **Discussion**

468 This study contributes to the literature on housing and health by exploring facilitators of and
469 barriers to funding, implementing, and scaling up housing interventions as health interventions.

470 We identified seven major themes from key informant interviews that shed light on the
471 multifaceted nature of housing interventions and their implications for public health.

472 KIs unanimously agreed that housing modifications could reduce transmission of
473 environmentally mediated infections as well as a broader set of outcomes, including mental
474 health and life satisfaction. This finding is in accordance with previous literature showing
475 reduced depression rates and stress levels upon housing improvements [14]. Similarly, two
476 studies conducted in Ecuador [23] and Vietnam [24] showed that housing satisfaction is a strong
477 predictor and key driver of life satisfaction, underscoring the importance of housing
478 interventions. KIs consistently stated that housing interventions should be prioritized within
479 health and development agendas as a complement to existing strategies, such as WASH
480 interventions.

481 KIs emphasized a pervasive shortage of funding and financial systems for
482 implementation and scale-up of housing interventions. A 2019 study elucidated that broader
483 measures like housing interventions are usually less recognized than disease-specific
484 interventions and, consequently, lack financial support [17]. As several KIs indicated, promoting
485 awareness of the significance of housing interventions is essential to garner greater support and
486 investment. KIs articulated a need for more rigorous evidence on health impacts of housing as
487 well as precise cost-benefit analyses, including a wide range of outcomes, to attracting donor
488 funding [17]. However, they also noted a lack of interest in and funding to generate new
489 evidence on housing interventions.

490 With regard to implementation and scale-up of housing interventions, KIs also revealed
491 that community involvement and governmental commitment are key factors. A 2012 qualitative
492 study on barriers to scaling up health interventions in low- and middle-income countries found

493 that initiatives often fail without engaging local implementers and recipient communities [25].
494 Moreover, the author emphasized the crucial role of national leaders in scaling up, a standpoint
495 echoed by multiple KIs who acknowledged the pivotal role of government involvement in
496 scaling up [25].

497 KIs stressed the urgent need to break silos and collaborate across disciplines to stimulate
498 research and action on housing and health. The importance of strong intersectoral collaboration
499 has been emphasized for other interventions; for example, the success of Singapore's dengue
500 control program was attributed to close cooperation among various government ministries, town
501 councils, communities, the private sector, and academic and research institutions alongside a
502 legislative framework [26]. Similarly, KIs emphasized the fundamental role of project-based and
503 context-specific housing policies in addressing social determinants of health such as housing.
504 This sentiment resonates with a 2021 comparative housing policy study, emphasizing the
505 importance of integrated policy responses across relevant areas to effectively address the strong
506 association between housing and health [27].

507 There were several limitations of this study. The relatively small number of stakeholders
508 (n = 16) may have restricted the diversity of viewpoints and themes. Furthermore, we did not
509 have KIs from government or communities, who could have provided valuable insights.
510 Similarly, we only invited KIs who could complete the interview in English, which may have
511 limited the diversity of perspectives in this study. Lastly, the broad spectrum of housing
512 interventions was discussed in a generic manner, which may have overlooked nuances specific to
513 particular interventions.

514

515 **Conclusions**

516 In conclusion, this study underscores the significant potential of housing interventions in
517 mitigating environmentally mediated diseases, offering an expansive approach to addressing
518 multiple health challenges simultaneously. Recommendations stemming from this research
519 include the urgent need to break down silos and foster collaboration among stakeholders, as well
520 as to improve awareness and education surrounding housing interventions. Concerted efforts
521 across disciplines and sectors are imperative to ensure healthy housing and achieve sustainable
522 development goals. Furthermore, efforts to prioritize housing interventions on the policy agenda
523 and to align diverse interests among stakeholders are essential for their effective implementation
524 and scale-up. Additionally, investing in generating rigorous evidence and promoting project-
525 based policies will be crucial for advancing the efficacy and impact of housing interventions in
526 improving public health outcomes.

527 **Declarations**

528 *Ethics approval and consent to participate*

529 This study was approved by the IRB (Protocol # 2023-11-16941) by the Office for Protection of
530 Human Subjects (OPHS) of the University of California, Berkeley. In addition, the study was
531 approved by the ETH Zurich Ethics Commission (EK-2023-N-317).

532 Participants provided informed consent prior to each respective interview.

533 *Consent for publication*

534 Not applicable.

535 *Availability of data and materials*

536 The datasets generated and analyzed during the current study are not publicly available due to
537 identifiable content.

538 *Competing interests*

539 The authors declare that they have no competing interests.

540 *Funding*

541 Not applicable.

542 *Authors' contributions*

543 JG and MA developed the original study concept, with JBC providing initial assistance. MA
544 acquired data and conducted data processing and led manuscript writing. JBC and JG advised on
545 interview guides, interviewee recruitment, and manuscript writing. All authors read and
546 approved the final manuscript.
