**44 I.** Abstract<br>45 After nearly a decade v<br>46 resurgence with 16 case<br>47 2.3.2.1c viruses. Fourteer After nearly a decade without reported human A/H5N1 infections, Cambodia faced a sudden<br>resurgence with 16 cases between February 2023 and August 2024, all caused by A/H5 clade<br>2.3.2.1c viruses. Fourteen cases involved a n 2.3.2.1c viruses. Fourteen cases involved a novel reassortant A/H5N1 virus with gene segments from<br>both clade 2.3.2.1c and clade 2.3.4.4b viruses. The emergence of this novel genotype underscores<br>the persistent and ongoing 2.3.2.1c viruses. Fourteen cases involved a novel reassortant A/H5N1 virus with gene segments from<br>both clade 2.3.2.1c and clade 2.3.4.4b viruses. The emergence of this novel genotype underscores<br>the persistent and ongoing both clade 2.3.2.1c and clade 2.3.4.4b viruses. The emergence of this novel genotype underscores<br>the persistent and ongoing threat of avian influenza in Southeast Asia. This study details the timeline<br>and genomic epidemiol the persistent and ongoing threat of avian influenza in Southeast Asia. This study details the timeline<br>and genomic epidemiology of these infections and related poultry outbreaks in Cambodia.<br>51<br>**II. Introduction** 50 and genomic epidemiology of these infections and related poultry outbreaks in Cambodia.<br>51<br>52 **II. Introduction** 

52<br>52<br>53<br>54 **II. Introduction**<br>53 Avian influenza viruses (AIVs),<br>54 have caused significant econor<br>55 (1). Monitoring AIV circulation Avian influenza viruses (AIVs), particularly highly pathogenic avian influenza (HPAI) A/H5N1 strains,<br>
have caused significant economic losses in the poultry industry and pose a serious zoonotic threat<br>
(1). Monitoring AIV have caused significant economic losses in the poultry industry and pose a serious zoonotic threat<br>
(1). Monitoring AIV circulation and evolution in high-risk regions, such as the Greater Mekong<br>
Subregion (GMS), is crucia (1). Monitoring AIV circulation and evolution in high-risk regions, such as the Greater Mekong<br>
Subregion (GMS), is crucial due to the region's heavy reliance on agriculture, particularly backyard<br>
poultry farming, which o Subregion (GMS), is crucial due to the region's heavy reliance on agriculture, particularly backyard<br>57 poultry farming, which often operates with minimal biosafety or biosecurity measures.<br>58 Cambodia, a lower middle-inco

57 poultry farming, which often operates with minimal biosafety or biosecurity measures.<br>58 Cambodia, a lower middle-income country in the GMS has a large socio-economic<br>50 agriculture and faces ongoing circulation of AIVs --<br>59<br>60<br>61<br>62 Cambodia, a lower middle-income country in the GMS has a large socio-economic dependence on<br>agriculture and faces ongoing circulation of AIVs in poultry. Longitudinal surveillance at key live bird<br>markets (LBMs) in Cambodi 60 agriculture and faces ongoing circulation of AIVs in poultry. Longitudinal surveillance at key live bird<br>61 markets (LBMs) in Cambodia has shown year-round co-circulation of AIVs of agricultural and zoonotic<br>62 concern markets (LBMs) in Cambodia has shown year-round co-circulation of AIVs of agricultural and zoonotic<br>62 concern including HPAI A/H5N1, low pathogenic avian influenza (LPAI) A/H9N2, and to a lesser<br>63 extent, A/H7 viruses<sup>1-</sup> 62 concern including HPAI A/H5N1, low pathogenic avian influenza (LPAI) A/H9N2, and to a lesser<br>extent, A/H7 viruses<sup>1-4</sup>. In addition, there has been infrequent detection of wild-bird-associated LPAI<br>subtypes, including extent, A/H7 viruses<sup>1-4</sup> extent, A/H7 viruses<sup>1-4</sup>. In addition, there has been infrequent detection of wild-bird-associated LPAI<br>subtypes, including A/H1, A/H2, A/H3, A/H4, A/H6, A/H10, A/H11, and even A/H14, the latter marking<br>the first detecti subtypes, including A/H1, A/H2, A/H3, A/H4, A/H6, A/H10, A/H11, and even A/H14, the latter marking<br>the first detection of this subtype in Asia<sup>5-7</sup>. Along with the high prevalence of AIV in poultry,<br>Cambodia has faced num the first detection of this subtype in Asia<sup>5-7</sup>. Along with the high prevalence of AIV in poultry,<br>66 Cambodia has faced numerous instances of zoonotic spillover between 2005 and 2014, resulting in<br>67 21 human cases of A Cambodia has faced numerous instances of zoonotic spillover between 2005 and 2014, resulting in<br>
67 21 human cases of A/H5N1, with 19 deaths (case-fatality rate [CFR]: 90.5%) by the end of 2012. In<br>
68 January 2013, a clad 21 human cases of A/H5N1, with 19 deaths (case-fatality rate [CFR]: 90.5%) by the end of 2012. In<br>68 January 2013, a clade 1.1.2 reassortant virus emerged in poultry in the GMS, containing the<br>69 hemagglutinin (HA) and ne January 2013, a clade 1.1.2 reassortant virus emerged in poultry in the GMS, containing the<br>
hemagglutinin (HA) and neuraminidase (NA) genes from a clade 1.1.2 genotype Z virus and internal<br>
genes from a clade 2.3.2.1a vi 69 hemagglutinin (HA) and neuraminidase (NA) genes from a clade 1.1.2 genotype Z virus and internal<br>60 genes from a clade 2.3.2.1a virus. Following the emergence of this novel reassortant, 26 new human<br>61 cases were repor The genes from a clade 2.3.2.1a virus. Following the emergence of this novel reassortant, 26 new human<br>
cases were reported in 2013 alone, with 15 deaths (CFR: 57.9%)<sup>5.8</sup>. The outbreak continued into the<br>
first quarter o cases were reported in 2013 alone, with 15 deaths (CFR: 57.9%) $^{5,8}$ cases were reported in 2013 alone, with 15 deaths (CFR: 57.9%)<sup>3,8</sup>. The outbreak continued into the first quarter of 2014, resulting in 8 confirmed cases and 4 deaths (CFR: 50%)<sup>9</sup>. This clade 1.1.2 first quarter of 2014 first quarter of 2014, resulting in 8 confirmed cases and 4 deaths (CFR: 50%)<sup>9</sup> first quarter of 2014, resulting in 8 confirmed cases and 4 deaths (CFR: 50%)<sup>9</sup>.
