 $\frac{1}{\sqrt{2}}$ \*corresponding author: e.vanheese@amsterdamumc.nl Brain clearance involves the drainage of waste molecules from the brain, a process that is suggested to be amplified during sleep. Recently proposed MRI-based methods attempt to<br>approximate human brain clearance with surrogate measures. The current study aimed to<br>explore whether two brain clearance surrogates ar approximate human brain clearance with surrogate measures. The current study aimed to explore whether two brain clearance surrogates are altered in narcolepsy. We processed diffusion-weighted and functional resting-state i explore whether two brain clearance surrogates are altered in narcolepsy. We processed<br>diffusion-weighted and functional resting-state images to extract two surrogates: Diffusion<br>Tensor Imaging Along the Perivascular Space explore whether the brain technical resting-state images to extract two surrogates: Diffusion<br>Tensor Imaging Along the Perivascular Space (DTI-ALPS index), and dBOLD-CSF coupling. Both<br>measures were analysed in 12 drug-fre diffusion-weighted and functional restingation-weighted and diffusion-measures were analysed in 12 drug-free, awake people with narcolepsy type 1 and 11 age- and sex-matched controls, as well as in relation to clinical fea measures were analysed in 12 drug-free, awake people with narcolepsy type 1 and 11 age- and<br>sex-matched controls, as well as in relation to clinical features. We also assessed the correlation<br>between the DTI-ALPS index and sex-matched controls, as well as in relation to clinical features. We also assessed the correlation<br>between the DTI-ALPS index and dBOLD-CSF coupling. The DTI-ALPS index and dBOLD-CSF<br>coupling amplitude identified were sim between the DTI-ALPS index and dBOLD-CSF coupling. The DTI-ALPS index and dBOLD-CSF coupling amplitude identified were similar to previous research and did not show significant differences between narcolepsy and controls, coupling amplitude identified were similar to previous research and did not show significant differences between narcolepsy and controls, nor significant relations with severity of excessive daytime sleepiness. We found a differences between narcolepsy and controls, nor significant relations with severity of excessive daytime sleepiness. We found a significant correlation between the DTI-ALPS index and dBOLD-CSF coupling amplitude. The hypothesis of altered brain clearance in narcolepsy type 1 is not supported by evidence from the curre exclusively sensitive to perivascular fluid, dBOLD-CSF coupling is reflecting large-scale CSF Example are of a supported by evidence from the current study. The two surrogates correlated with each other,<br>suggesting that both offer different perspectives from the same underlying physiology. Yet, the<br>suitability of t suggesting that both offer different perspectives from the same underlying physiology. Yet, the<br>suitability of the surrogates as brain clearance markers remains debatable. Whereas DTI is not<br>exclusively sensitive to periva suitability of the surrogates as brain clearance markers remains debatable. Whereas DTI is not<br>exclusively sensitive to perivascular fluid, dBOLD-CSF coupling is reflecting large-scale CSF<br>motion. Future work should explor exclusively sensitive to perivascular fluid, dBOLD-CSF coupling is reflecting large-scale CSF<br>motion. Future work should explore other surrogate markers, preferably during sleep, to better<br>understand the possible role of a motion. Future work should explore other surrogate markers, preferably during sleep, to better<br>understand the possible role of altered brain clearance in narcolepsy type 1 symptomatology.<br>**Keywords:** Narcolepsy type 1 • Hy

dense connections to the brainstem nuclei and basal forebrain (Ebrahim et al., 2002).<br> **Brain clearance**<br>
Research on brain clearance has recently gained popularity in the context of healthy sleep and<br>
sleep disorders. One **Brain clearance**<br>Research on brain clearance has recently gained popularity in the context of health<br>sleep disorders. One of the important elements of the brain clearance syste<br>cerebrospinal fluid (CSF) movement along cha Ⅱ Ⅰ S C N Seep disorders. One of the important elements of the brain clearance system involves<br>cerebrospinal fluid (CSF) movement along channels surrounding the blood vessels: the<br>perivascular spaces. These channels are proposed to Sleep measures. The international disorders in the international corresponding the blood vessels: the perivascular spaces. These channels are proposed to be the main pathways for CSF-mediated clearance. Brain clearance is perivascular spaces. These channels are proposed to be the main pathways for CSF-mediated<br>clearance. Brain clearance is suggested to be amplified during sleep based on observations of<br>faster amyloid- $\beta$  clearance and int  $\Gamma$ <br>clearance. Brain clearance is suggested to be amplified during sleep based on observations of<br>faster amyloid- $\beta$  clearance and interstitial fluid (ISF) compartment enlargements in sleeping<br>mice, and larger CSF compa contract the clearance and interstitial fluid (ISF) compartment enlargements in sleeping<br>mice, and larger CSF compartment volume in sleeping humans (Demiral et al., 2019; Xie et al.,<br>2013). Moreover, sleep deprivation in h face, and larger CSF compartment volume in sleeping humans (Demiral et al., 2019; Xie et al., 2013). Moreover, sleep deprivation in humans has been shown to slow down brain clearance (studied using tracer enrichment after 2013). Moreover, sleep deprivation in humans has been shown to slow down brain clearance (studied using tracer enrichment after intrathecal injections; (Eide et al., 2021). Currently, different models exist to describe the (studied using tracer enrichment after intrathecal injections; (Eide et al., 2021). Currently,<br>different models exist to describe the anatomy and direction of fluid movement underlying brain<br>clearance (Bakker et al., 2019; (Sufferent models exist to describe the anatomy and direction of fluid movement underlying brain<br>clearance (Bakker et al., 2019; Carare et al., 2008; Iliff et al., 2012; Zhao et al., 2022).<br>Altered brain clearance in narco

### Altered brain clearance in narcolepsy?<br>...

clearance (Bakker et al., 2019; Carare et al., 2008; Iliff et al., 2012; Zhao et al., 2022).<br>Altered brain clearance in narcolepsy?<br>There are several lines of evidence suggesting the presence of brain clearance alterations Altered brain clearance in narcolepsy?<br>There are several lines of evidence suggesting the presence of brain clearance<br>narcolepsy. First, the hypothesis of altered clearance is supported by narc<br>characterised by a highly di  $\begin{array}{c} \n1 \quad \text{if} \quad \text{if}$ narcolepsy. First, the hypothesis of altered clearance is supported by narcolepsy being<br>characterised by a highly disrupted sleep-wake cycle (i.e. high number of awakenings, altered<br>sleep stage transitions, more time spent characterised by a highly disrupted sleep-wake cycle (i.e. high number of awakenings, altered<br>sleep stage transitions, more time spent in stage 1 non-rapid eye-movement [NREM] sleep, and<br>fragmented NREM sleep; (Pizza et al fragmented NREM sleep; (Pizza et al., 2015; Roth et al., 2013). Brain clearance is suggested to be sleep statemented NREM sleep; (Pizza et al., 2015; Roth et al., 2013). Brain clearance is suggested to be amplified during NREM sleep, presumably stage 2 and/or 3. We hypothesise that the disrupted sleep-wake cycle in narc

fragmented NREM sleep, presumably stage 2 and/or 3. We hypothesise that the disrupted<br>sleep-wake cycle in narcolepsy could be related to altered brain clearance.<br>Second, abnormal levels of CSF biomarkers support the idea o amplified during their treep, presumately stage 2 and, i.e. the dig products that the during that<br>sleep-wake cycle in narcolepsy could be related to altered brain clearance.<br>Second, abnormal levels of CSF biomarkers suppor second, abnormal levels of CSF biomarkers support the idea of altered classical CSF measurements are often performed in people with narcolepsy, that is deficiency. Several studies have used this opportunity to investigate Spinal CSF measurements are often performed in people with narcolepsy, to confirm hypocretin-1 deficiency. Several studies have used this opportunity to investigate other CSF biomarkers, mostly neurodegenerative markers s deficiency. Several studies have used this opportunity to investigate other CSF biomarkers, mostly<br>neurodegenerative markers such as amyloid- $\beta$ , phosphorylated and total tau, and neurofilament<br>light. A summary of this w neurodegenerative markers such as amyloid-ß, phosphorylated and total tau, and neurofilament neurogenerative markers such as amyloin p) prospects and total tal., 2020; Heier et al., 2014;<br>Jennum et al., 2017; Kallweit et al., 2012; Liguori, Placidi, Albanese, et al., 2014; Liguori, Placidi, et<br>al., 2016; Lozano-T Jennum et al., 2017; Kallweit et al., 2012; Liguori, Placidi, Albanese, et al., 2014; Liguori, Placidi, et<br>al., 2016; Lozano-Tovar et al., 2024; Shimada et al., 2020; Strittmatter et al., 1996; P. Wang et al.,<br>2021). Wher al., 2016; Lozano-Tovar et al., 2024; Shimada et al., 2020; Strittmatter et al., 1996; P. Wang et al.,<br>2021). Whereas the CSF marker deviations in narcolepsy are bidirectional, most evidence points<br>towards lower levels in 2021). Whereas the CSF marker deviations in narcolepsy are bidirectional, most evidence points<br>towards lower levels in spinal CSF of amyloid-β, phosphorylated and total tau compared to<br>healthy controls (Jennum et al., 201 2022). Whereas the CSF marker deviations in the CSF phosphorylated and total tau compared to healthy controls (Jennum et al., 2017; Liguori, Placidi, Albanese, et al., 2014; Liguori, Placidi, et al., 2016). It is also hyp towards lower lower law spinal Core analysism py prospects yinter and total tau compare in the leading healthy controls (Jennum et al., 2017; Liguori, Placidi, Albanese, et al., 2014; Liguori, Placidi, et al., 2016). It i 2016). It is also hypothesised that the lowest levels of amyloid- $\beta$  are present at disease onset if it is triggered by inflammation, and that long-term treatment with psychostimulants might induce 2012). It is also hypothesised that the lower that the lower processes in the lower state is triggered by inflammation, and that long-term treatment with psychostimulants might induce neuronal metabolic changes resulting is triggered by inflammation, and that long-term is changed by incrementing in page that the CSF neuronal metabolic changes resulting in higher levels of neurodegenerative markers in the CSF (Liguori, Placidi, Izzi, et al. (Liguori, Placidi, Izzi, et al., 2014). Whereas, lower levels of waste molecules in spinal CSF could (Liguori, Placidi, Izzi, et al., 2014). Whereas, lower levels of waste molecules in spinal CSF could

 $\begin{array}{c} 2 \\ 1 \\ 2 \\ 3 \end{array}$ 

suggest whether in the brain in the brain of impaired the brain of interest whether lower marker levels in people with narcolepsy, emich in dearance.<br>Third, findings from MRI diffusivity studies in people with narcolepsy, Third, findings from MRI diffusivity studies in people with narcolepsy, which identi<br>widespread diffusivity alterations, further hint towards possible fluid motion changes<br>narcolepsy. Specifically, a lower measure of diffu widespread diffusivity alterations, further hint towards possible fluid motion changes in<br>narcolepsy. Specifically, a lower measure of diffusion directionality (fractional anisotropy), higher<br>measure of axon myelination (r marcolepsy. Specifically, a lower measure of diffusion directionality (fractional anisotropy), higher<br>measure of axon myelination (radial diffusivity), and unaffected measures of axon organisation<br>and mean diffusion streng measure of axon myelination (radial diffusivity), and unaffected measures of axon organisation<br>and mean diffusion strength (axial diffusivity, mean diffusivity) were identified in people with<br>narcolepsy compared to control measure of anti-axon myellination strength (axial diffusivity, mean diffusivity) were identified in people with<br>narcolepsy compared to controls (Gool et al., 2019; Juvodden et al., 2018; Park et al., 2016; Tezer<br>et al., 20 marcolepsy compared to controls (Gool et al., 2019; Juvodden et al., 2018; Park et al., 2016; Tezer<br>et al., 2018). The diffusivity alterations may suggest white matter alterations of lower<br>myelination, lower axonal density narcolepsy compliment to controlling (ECT COM, ECT), processed to mix 2019) cancel at al., 2018). The diffusivity alterations may suggest white matter alterations of lower myelination, lower axonal density, or greater axon et al., 2023). The alternatively alternative alternative interations in the diffusivity of the post-mortem histology experiments (Gool et al., *submitted*). It remains unclear to what extent myelin and axonal integrity are my channels, there are alternal density, or greater and annual dimension, parameterism, constrained post-mortem histology experiments (Gool et al., *submitted*). It remains unclear to what extent myelin and axonal integrit myelin and axonal integrity are affected in narcolepsy type 1, or whether other factors<br>contributed to the diffusivity differences (Gool et al., 2024). We consider the possibility that these<br>diffusivity alterations are rel contributed to the diffusivity differences (Gool et al., 2024). We consider the possibility that these diffusivity alterations are related to brain clearance alterations in narcolepsy, for instance through larger perivascu diffusivity alterations are related to brain clearance alterations in narcolepsy, for instance

### MRI-based surrogates of brain clearance

through larger perivascular spaces and their contribution to the diffusivity measures.<br>
MRI-based surrogates of brain clearance<br>
Neuroimaging studies have applied contrast-enhanced MRI to monitor tracer clearance and study MRI-based surrogates of brain clearance<br>Neuroimaging studies have applied contrast-enhanced MRI to monitor tracer clearanc<br>the human brain clearance system *in vivo*. Other MRI methods, such as adaptations of<br>labelling and I<br>I<br>t<br>i the human brain clearance system *in vivo*. Other MRI methods, such as adaptations of arterial spin<br>labelling and diffusion-weighted imaging, have been pursued to image brain clearance with a non-<br>invasive approach (as sum

the human brain clearance system *m vivo*. Other MRI methods, such as adaptations of arterial spin<br>labelling and diffusion-weighted imaging, have been pursued to image brain clearance with a non-<br>invasive approach (as summ labelling and diffusion-weighted imaging to performation-periodic imaginary between pursues and pulations (>140<br>publications in the last 5 years). The index is calculated based on diffusivity in a small area of the<br>brain w Taoka and colleagues (Taoka et al., 2017) proposed a post-proc<br>diffusion tensor images: diffusion tensor image analysis along t<br>SFig. 1). The DTI-ALPS index aims to reflect diffusion along the p<br>brain clearance and has bee diffusion tensor images: diffusion tensor image analysis along the perivascular space (DTI-ALPS,<br>SFig. 1). The DTI-ALPS index aims to reflect diffusion along the perivascular space as a measure of<br>brain clearance and has b SFig. 1). The DTI-ALPS index aims to reflect diffusion along the perivascular space as a measure of brain clearance and has been widely applied in a diverse range of clinical populations (>140 publications in the last 5 ye publications in the last 5 years). The index is calculated based on diffusivity in a small area of the<br>brain with a unique, perpendicular position of two fibre tracts and blood vessels, next to the<br>lateral ventricles. Neur publication with a unique, perpendicular position of two fibre tracts and blood vessels, next to the lateral ventricles. Neurodegenerative disorders in which protein accumulations play a central role, such as Alzheimer's a lateral ventricles. Neurodegenerative disorders in which protein accumulations play a central<br>role, such as Alzheimer's and Parkinson's disease, showed lower DTI-ALPS indices compared to<br>healthy controls (Cai et al., 2023; role, such as Alzheimer's and Parkinson's disease, showed lower DTI-ALPS indices compared to<br>healthy controls (Cai et al., 2023; Chang et al., 2023; Chen et al., 2021; Ma et al., 2021; Taoka et al.,<br>2017). Of note, the ind role, such as Alzheimer's and What it claims to reflect has been disputed as DTI-ALPS is not CSF-<br>2017). Of note, the index and what it claims to reflect has been disputed as DTI-ALPS is not CSF-<br>nor ISF-selective and is o health y controls (Cai et al., 2023) controls (Cai et al., 2023) controls (Cai et al., 2017). Of note, the index and what it claims to reflect has been disputed as DTI-ALPS is not CSF-<br>nor ISF-selective and is only measure could therefore also originate from changes in tissue pulsatility, changes in white matter<br>structure or presence of more fluid in the brain (i.e. enlarged PVS, free water due to<br>demyelination, white matter hyperintensities

Another non-invasive method allows to investigate the coupling between neurovascular-driven structure or presence of more fluid in the brain (i.e. enlarged PVS, free water due to demyelination, white matter hyperintensities; Ringstad, 2024; Taoka et al., 2024).<br>Another non-invasive method allows to investigate th structure or presence of more fluid in the brain (i.e. enlarged PD). The brain distribution demyelination, white matter hyperintensities; Ringstad, 2024; Taoka et al., 2024).<br>Another non-invasive method allows to investiga demy changes matter to predict the coupling between neuro<br>fluctuations of the blood volume in the cortical grey matter with CSF oscillations at<br>fourth ventricle (Fultz et al., 2019). An anti-correlation is observed between Another and the blood volume in the cortical grey matter with CSF oscillations at the level of the fourth ventricle (Fultz et al., 2019). An anti-correlation is observed between cortical grey matter activity (BOLD signal) fourth ventricle (Fultz et al., 2019). An anti-correlation is observed between cortical grey matter<br>activity (BOLD signal) and CSF waves in awake participants, which is significantly enhanced<br>during sleep. The coupling bet Fourth ventricle (Fultr 2018). The mini-correlation is particle for the left altitude phanced<br>activity (BOLD signal) and CSF waves in awake participants, which is significantly enhanced<br>during sleep. The coupling between t during sleep. The coupling between the two signals is explained by the following mechanism:<br>activity fluctuations in the cortex give rise to cerebral blood volume changes, which in turn push<br>CSF out, or allow for CSF inflo activity fluctuations in the cortex give rise to cerebral blood volume changes, which in turn push<br>CSF out, or allow for CSF inflow, due to the restricted space inside the skull (Monroe-Kellie<br>doctrine). Altogether this dB CSF out, or allow for CSF inflow, due to the restricted space inside the skull (Monroe-Kellie doctrine). Altogether this dBOLD-CSF coupling reflects how cerebral blood volume changes can be a driving force for CSF mobility. The dBOLD-CSF coupling method has been applied in healthy people during sleep (Fultz et al., 2019), and Alzheimer's Disease (Han, Chen, et al., 2021) and Parkinson's Disease during wake (Han, Brown, et al., 2021; Z. Wang et al., 2023). Parkinson's Disease during wake (Han, Brown, et al., 2021; Z. Wang et al., 2023).

| ISF, whereas hypocretin antagonists or hypocretin knockouts showed lower levels and less<br>plaque formation (Kang et al., 2009). As these changes in amyloid- $\beta$  levels co-occurred with<br>improved or disrupted sleep, it is pr improved or disrupted sleep, it is proposed that this effect of hypocretin on amyloid- $\beta$ metabolism and clearance is solely mediated through the sleep-wake cycle (Berteotti et al., 2021).<br>In humans, it is known that hypocretin and amyloid-β in the CSF show circadian fluctuations<br>related to each other (Slats In humans, it is known that hypocretin and amyloid- $\beta$  in the CSF show circadian fluctuations<br>related to each other (Slats et al., 2012). Additionally, significantly higher levels of hypocretin are<br>observed in CSF of peo In telated to each other (Slats et al., 2012). Additionally, significantly higher levels of hypocretin are<br>observed in CSF of people with AD pathology, and higher levels correlated with insomnia<br>symptoms (Liguori, Nuccete related in CSF of people with AD pathology, and higher levels correlated with insomnia<br>symptoms (Liguori, Nuccetelli, et al., 2016). In animals, as well as humans, beneficial effects of<br>hypocretin antagonists have been ob symptoms (Liguori, Nuccetelli, et al., 2016). In animals, as well as humans, beneficial effects of<br>hypocretin antagonists have been observed on sleep, amyloid- $\beta$ -related neurodegeneration, and<br>cognition (Berteotti et al by ocretin antagonists have been observed on sleep, amyloid-β-related neurodegeneration, and<br>cognition (Berteotti et al., 2021). Specifically to narcolepsy, it is proposed that the low hypocretin<br>signalling reduces the r cognition (Berteotti et al., 2021). Specifically to narcolepsy, it is proposed that the low hypocretin signalling reduces the risk of amyloid-β accumulations and thus Alzheimer's Disease (Berteotti et al., 2021). Evidenc signalling reduces the risk of amyloid- $\beta$  accumulations and thus Alzheimer's Disease (Berteotti et al., 2021). Evidence, so far, is sparse, with one post-mortem study showing a similar prevalence of<br>amyloid-β neuropathology as in the general population (Alzheimer's Disease was present in 4 out<br>of 12 cases of narcolepsy anyloid-β neuropathology as in the general population (Alzheimer's Disease was present in 4 out of 12 cases of narcolepsy type 1; (Scammell et al., 2012) and one PET study showing a lower brain amyloid burden and lower pat amyloid-β neuropathology as in the general population (Chancellic Present in population of 12 cases of narcolepsy type 1; (Scammell et al., 2012) and one PET study showing a lower brain amyloid-burden and lower-pathologic amyloid burden and lower pathological amyloid accumulation in individuals with narcolepsy<br>(Gabelle et al., 2019).<br>All in all, it remains to be further explored whether brain clearance is altered in narcolepsy type 1.<br>As th

the Curve (Fig. 38). The Curve (Fig. 38). The Curve (Fig. 38). The Curve (Fig. 38). The DTI-ALPS<br>The DTI-ALPS method (Taoka et al., 2017) is recent, but widely applied in the past years. The<br>main reason for this popularity bomogenous, which is the DTI-ALPS<br>The DTI-ALPS method (Taoka et al., 2017) is recent, but widely applied<br>main reason for this popularity is likely related to the possibility correlation the method of the Method of the Meth The DTI-LI-T INCHER (THEM 2018), THE DEVITY, THE READLY SEPTERTHE IN FRIEF, THE MARY MARK main reason for this popularity is likely related to the possibility of applying the method retrospectively, on already processed DT matrices in addition, the methodological procedure is<br>easy and not highly time-consuming. The validity of the DTI-ALPS index, however, has been<br>debated, with a focus on what the index measures (Ringstad, 2024; Taoka et al. retrospectively, on incready processes in a matrice in admition, the instance leasy and not highly time-consuming. The validity of the DTI-ALPS index, however, has been debated, with a focus on what the index measures (Rin debated, with a focus on what the index measures (Ringstad, 2024; Taoka et al., 2024). Without<br>violation of the underlying assumptions, the index supposedly reflects perivascular fluid flow in a<br>small region of brain paren violation of the underlying assumptions, the index supposedly reflects perivascular fluid flow in a<br>small region of brain parenchyma next to the lateral ventricle, in the perivascular channels<br>surrounding the deep medullar small region of brain parenchyma next to the lateral ventricle, in the perivascular channels<br>surrounding the deep medullary veins. The measure is thus highly specific to a small area of the<br>brain and does not present an ac surrounding the deep medullary veins. The measure is thus highly specific to a small area of the<br>brain and does not present an accurate reflection of CSF-mediated clearance at the whole-brain<br>level. Regional brain clearanc surrounding the deep measure of the measure is the measure in the detailed the whole-brain<br>level. Regional brain clearance effects, as suggested in previous studies (Eide et al., 2021), would<br>therefore not be captured in t level. Regional brain clearance effects, as suggested in previous studies (Eide et al., 2021), would<br>therefore not be captured in the DTI-ALPS index. The assumed unique position of the projection<br>and association fibres in therefore not be captured in the DTI-ALPS index. The assumed unique position of the projection<br>and association fibres in relation to the veins, perpendicular in all directions, can also be<br>discussed in previous studies (Ei and association fibres in relation to the veins, perpendicular in all directions, can also be and association fibres in relation fibres in relation to the veins, perpendicular in all d irections, can also be

ו<br>ג<br>ז presented. In this studies with the many other applications of an image visualising veins (i.e. susceptibility-weighted image), led us to draw the regions of interest without confirming the presence of underlying deep medu of an image visualizing veins (i.e. survey pressure along y) or a letterator the region of interest without confirming the presence of underlying deep medullary veins. Finally, possible violation of other assumptions, as t violation of other assumptions, as the sequence is not CSF- nor ISF specific, could result in the<br>DTI-ALPS index not accurately representing perivascular fluid flow, but rather residual diffusion,<br>tissue motion, slow blood DTI-ALPS index not accurately representing perivascular fluid flow, but rather residual diffusion,<br>tissue motion, slow blood flow, or white matter alterations. The doubts surrounding the DTI-ALPS<br>method led us to perform a tissue motion, slow blood flow, or white matter alterations. The doubts surrounding the DTI-ALPS<br>method led us to perform a multi-perspective approach in this study, which allowed for a<br>comparison of the DTI-ALPS outcomes the method led us to perform a multi-perspective approach in this study, which allowed for a comparison of the DTI-ALPS outcomes with the dBOLD-CSF coupling analysis.<br> *dBOLD-CSF*<br>

### Figures

Fig. 1. DTI-ALPS index group differences for the left and right hemisphere. No significant differences were found between the hemispheres and between narcolepsy and controls. Means, standard deviations, and estimates from the regression model are reported in Table 3.

Fig. 2. BOLD-CSF coupling amplitude (A) and coupling curve (B). (A) Quantification of retrieved amplitudes for narcolepsy (purple) and controls (grey). (B) Mean  $\pm$  SD dBOLD-CSF coupling curve for narcolepsy (pink) and controls (grey). The peak closest to zero has an average coupling curve for narcolepsy (pink) and controls (grey). The peak closest to zero has an average amplitude and lag of 0.50 and -4.13 seconds (narcolepsy) and 0.43 and -4.09 seconds (controls). Means, standard deviations, and estimates from the regression model are reported in Table 4.

Fig. 3. Signal fluctuations in the dBOLD (A) and CSF (B) signal. Area Under the Curve (AUC) is shown for normalised, detrended, and filtered dBOLD and CSF time series. The AUC did not significantly differ between people with narcolepsy and controls for the dBOLD ( $p=239$ ), as well as the CSF time series  $(p=304)$ .

Fig. 4. DTI-ALPS (A) and dBOLD-CSF coupling (B) correlated with Epworth Sleepiness Scale, a measure of excessive daytime sleepiness. Regression lines are drawn based on data points a measure of excessive daytime sleepiness. Regression lines are drawn based on data points from narcolepsy and controls combined. DTI-ALFS: Pearson's  $r = 0.31$ , p value = .154; BOLD-CSF.<br>-Pearson's  $r = 0.27$ ,  $p$  value = .208. Abbreviations: ESS, Epworth Sleepiness Scale.<br>DTI-ALPS and dBOLD-CSF

 $\overline{a}$ Fig. 5. Correlation between DTI-ALPS index and dBOLD-CSF coupling amplitude. Higher DTI-ALPS index (y) is significantly correlated to larger dBOLD-CSF amplitude (x). Pearson's  $r = 0.46$ ,  $p$ value =  $025$ .
