	78	ABSTRACT
--	----	----------

Rural and isolated communities, such as Culebra, Puerto Rico, face significant healthcare challenges due to geographic isolation, limited medical resources, and socioeconomic disadvantages. Chronic diseases, particularly diabetes and hypertension, are prevalent and contribute to poor health outcomes. Telehealth services (THS) and community health workers (CHWs) have been identified as effective interventions for improving healthcare access in underserved areas. This study aimed to explore the community perceptions and attitudes towards integrating THS with the support of CHWs to enhance chronic disease management in Culebra. Methods A Qualitative Research approach involved 20 patients from Culebra's Federally Qualified Health Center (FQHC). Semi-structured interviews were conducted, guided by the Socio-Ecological Model (SEM), to assess community perspectives toward THS and CHWs at individual, interpersonal, community, and societal levels. Thematic analysis revealed three primary themes: social determinants of health, the role of CHWs, and the benefits and challenges of THS. Results Findings indicate that CHWs play a critical role in improving healthcare access by assisting with medical appointments, medication management, and providing emotional support. THS was recognized for its potential to reduce transportation barriers and improve continuity of care, though concerns regarding convenience, technology access, and data privacy persist. The integration of CHWs and THS was viewed positively as a solution to healthcare access challenges, with participants expressing trust in this model for managing chronic diseases. Discussion This study highlights the need for further development of THS infrastructure and CHW support to ensure equitable healthcare access in rural areas like Culebra. The combination of THS and CHWs shows promise for reducing healthcare disparities and improving outcomes for isolated populations. Future

BACKGROUND

In the United States (US), one in five communities represents a rural or isolated area.(1) Rural and isolated communities face numerous healthcare challenges, typically as consequences of having limited access to healthcare due to their lower socioeconomic status and geographic location relative the services.(2, 3) The health outcomes of people living in rural communities, such as survival rate, complication frequency, and disease management, are often worse compared to people living in urban areas, resulting in a significant public health crisis.(4) The same factors impact the health and healthcare of persons in Latinx communities, including a higher prevalence of chronic conditions such as diabetes (10.3% in Hispanic communities compared to 8.5% in non-Hispanic white communities) among adults aged 18 years or older.(5) These disparities are even more pronounced for people living in Puerto Rico. who experience the worst health outcomes compared to the general US population, having an estimated diabetes prevalence of 20.1% among adults.(6) Puerto Rico (PR) is a territory of the US that includes many rural communities that experience further isolation by an amalgam of factors. Chronic diseases, such as diabetes and hypertension, represent pressing public health problems in many rural and isolated communities in PR. According to The Centers for Disease Control and Prevention (CDC), chronic diseases are the leading cause of death among adults in the US and PR.(7) Compared to other jurisdictions in the US, previous studies had suggested a higher prevalence of chronic diseases among people in PR; hypertension (39% vs 36%) and high cholesterol (16% vs 10%).(8) Most people in PR (98.9%) self-identify as Latinx/Hispanic in official federal documents. PR is an archipelago with three inhabited islands; most people live in the "big island" of Puerto Rico, and the two populated island municipalities are Culebra and Viegues. Culebra is the smallest of the inhabited islands, located 17 miles east of the island of PR with an extension of 11.62 mi². The island of Culebra is the least populous municipality of PR, with a population of 1,792. Among its residents, the median age is 44.6 years, 23.5% live under the poverty level, 56.7% are unemployed, and 13.5% don't have healthcare coverage.(9) The estimated prevalence of diabetes and hypertension were 15.1% and 39.2%, respectively, in Culebra (2019).(10) The people of Culebra have historically faced numerous challenges accessing

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this preprint (which was not certified by peer review) is the amagin for the approximate medRxiv a license to display the preprint in perpetuil age 8 of 27

healthcare services.(11) Geographic isolation, scarce medical resources, and a shortage of healthcare providers all affect the consistent medical care, particularly for those with chronic diseases. They rely on the health services on the main island, already strained by the lack of enough providers due to migration, causing long waiting times for service.(12) The lack of reliable transportation to the main island exacerbates these barriers to access to care. (13-15) These challenges are social determinants of health (SDoH) that result in significant health inequities affecting the lives of island residents. Healthcare responses to the COVID-19 pandemic have demonstrated that Telehealth services (THS) and the deployment of community health workers (CHWs) increase access to care and improve health outcomes, particularly in rural areas that were previously underserved.(16) However, THS has not been equitably available, and rural communities such as those in PR have vet to benefit from this opportunity for increased access.(17) The healthcare disparities and challenges associated with chronic disease management faced by Culebra or similar communities have not been fully addressed, particularly with the integration of CHWs and THS in improving the health outcomes of rural and isolated communities. Considering the opportunity to provide evidence-based services to improve access to care services for Latinx populations in isolated communities, this study aimed to explore the community perceptions and attitudes toward integrating THS with the support of CHWs to improve healthcare access for people with chronic diseases in isolated areas such as the island of Culebra, PR. **METHODS Research Team**

This research was implemented by an established Community-Academic Partnership (CAP) between a
research academic institution and HealthproMed Inc., the only Federally Qualified Health Center (FQHC)
in Culebra. The CAP identified the need to understand how the community perceived the potential
implementation of two evidence-based interventions (EBI): 1) CHWs assisted 2) THS for patients with a
specialist referral to manage their chronic disease (e.g., diabetes and hypertension). The research team
integrated the Socio-Ecological Model (SEM) as a theoretical framework to explore how the community

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this Page 9 of 27 perint (which was not certified by peer review) is the amagin funder where the preprint in perpetuity.

3	182	perspectives were related within and across different and multiple levels. With this approach, findings
4 5 7 8 9 10 11 12 13 14 15 16	183	would support the comprehensive implementation of these integrated interventions.(18)
	184	The research team comprised a multidisciplinary group of professionals, including a trained and certified
	185	community health worker in Culebra, FQHC personnel, including a nurse and health specialist provider,
12	186	and the study team located in Rochester, NY. The team's collective efforts aim to create a culturally
14	187	congruent, ethically sound research environment that contributes to the academic field and brings tangible
16	188	improvements to healthcare access and better management of individuals in isolated island communities
17 18	189	like Culebra. This study was approved by the URMC Institutional Review Board #STUDY00007257 and
19 20	190	followed COREQ guidelines to report qualitative research.(19)
21 22 22	191	
23 24 25	192	Study Design
26	193	This study focused on ascertaining community perceptions toward THS infrastructures and the role of
28	194	CHWs in addressing health access for people with chronic diseases. For this qualitative study, we
30	195	recruited 20 community patients from the local FQHC in Culebra, using a purposive sampling
32 33	196	methodology and direct recruitment efforts from CHWs. A total of 20 participants were recruited, which
24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42	197	was considered sufficient to provide adequate information power. Information Power approach facilitates
	198	the justification for this smaller sample size by having the study with a specific aim, a focused sample,
39	199	and strong interactions between participants and researchers.(20) Participants were required to be older, at
39 40 41 42 43	200	least 18 years old, live in Culebra, have a chronic disease diagnosis, and be able to read the information
	201	provided in Spanish for informed consent. The exclusion criteria included non-residents, non-patients of
45	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	the local FQHC, and unable to communicate in Spanish. The study was conducted in Spanish because it is
47	203	the official language in PR and the primary language of most of Culebra's residents.
48 49 50	204	
50 51 52	205	An interview guide for semi-structured qualitative interviews was developed and conducted by a team
52 53 54	206	member proficient in qualitative research methodologies and fluent in Spanish.(21) The interview guide
55 56	207	was developed using the SEM framework to capture in-depth perceptions of THS and the role of CHWs
57 58	207	and developed using the SEAT numeriors to cupture in deput perceptions of 1115 and the fore of CITWS

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this preprint (which was not certified by peer review) is the approximation of the preprint in perpetident and the preprint and th

in the community as an intervention to increase access to healthcare. Our research team member experienced in qualitative research methodology conducted all interviews in Spanish. The Rapid Qualitative Inquiry (RQI) method allowed for a dynamic and iterative data collection and analysis process, which supported the identification of salient themes and patterns.(22) Participants were recruited from the clinic's patient population and were informed of their rights to discontinue participation or skip questions at any point. The interviews lasted up to an hour and were conducted in familiar community settings, such as the facilities of the FQHC and community centers, ensuring a comfortable and private environment for participants to share their experiences. Thematic analysis was conducted and supported the identification of salient topics shared by participants.(23) Themes and supportive quotes were translated and back-translated from Spanish to English by two Spanish-speaking speakers members of the research team following the Brislin Back-Translation Method to address interval validity.(24)

Participants were compensated with \$10.00 cash at the end of the interviews. Additionally, they were offered refreshments in a culturally congruent manner to express gratitude for their participation. The study design prioritized participant privacy and data protection. Data were collected anonymously, and participants were encouraged not to disclose identifiable information during the interviews. However, any identifiable information to participants was removed from transcripts and data analysis. Risks were minimized by de-identifying all data in the final analysis, thus preserving participant confidentiality. Interview audio files were initially stored on encrypted phones, transferred to encrypted computers, and uploaded into a cloud-based HIPAA-compliant software with 256-bit encryption and SSL-EV to ensure the highest level of data protection. Table 1 presents the demographic profile of the 20 participants, who predominantly self-identified as

female (n=12; 60%) and with a diverse age range (20-70 years old). Most participants shared their age,
including from their 20s to their 70s. However, (n=8; 40%) of the participants declined to disclose their
age. The average interview duration was 55 minutes and 42 seconds. Participants' educational levels
varied, with a slight majority having completed or exceeded high school (n=11; 55%) and a quarter

234 having less than a high school education. Interviews were conducted between October 2022 and March 235 2023.

1

237 **Data Preparation and Analysis**

238 Qualitative data analysis was conducted using Dedoose[®], a qualitative analysis software that allows for 239 direct coding. (25) Interview data were examined iteratively using thematic analysis for patterns and 240 themes, investigating community attitudes and perceptions toward THS systems and the community 241 health worker's model.(23) The analysis was guided by the SEM,(18) which provided a comprehensive 242 understanding of participants' attitudes and perceptions toward our integrated model. The team regularly 243 $(\geq 5 \text{ times per week})$ debriefed about findings during fieldwork with partners and community members.

245 **RESULTS**

246 Identified themes and subthemes were categorized across SEM domains to provide a comprehensive 247 understanding of the factors influencing participants' perceptions of implementing integrated, evidence-248 based interventions. As shown in Figure 1, the SEM domains include Individual, Interpersonal, 249 Community, and Societal levels, each addressing three main themes with subthemes: social determinants 250 of health, the role of CHWs, and the impact of THS services.(18) This categorization helped illustrate 251 how these factors interact and contribute to the understanding of the community's perspectives and 252 attitudes toward integrating THS with the support of CHWs to improve healthcare access for people with 253 chronic diseases on the island of Culebra. The most relevant subthemes of each theme will be discussed in 254 the following sessions.

255 Theme 1 (T1): Social Determinants of Health

256 Participants highlighted several key issues affecting their community, including limited educational 257 resources, economic instability, violence, and inadequate housing and transportation (Table 2). These 258 factors create significant barriers to health and well-being, emphasizing the need for community-based

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this preprint (which was not certified by peer review) is the away/funder where signated medRxiv a license to display the preprint in perpetuage 12 of 27

It is made available under a CC-BY-NC-ND 4.0 International license .

interventions and policies to address these underlying causes of health disparities in rural and isolated areas.

Subtheme: Transportation Problems

Transportation was identified as a significant issue, with the community's geographical isolation contributing to difficulties in accessing other areas. This affects daily life and service provision. A participant explained, "Well, transportation, Like Vieques and Culebra, we are, as you say, far from the big island, so sometimes we have a lot of problems with transportation, that's more than most of what it affects" (IND49). This reflects societal-level challenges.

Subtheme: Environmental Health Hazards

The improper management of sewage and wastewater was identified as a severe environmental and health concern by the Culebra community. Overflows cause a threat to the cleanliness and hygiene of the community, as expressed by one participant: "Sewage is overflowing everywhere. It is really a very strong concern." On the other hand, participants also discussed the negative impact of exploitation-induced destruction, particularly from investors and unsustainable practices. This leads to the destruction of natural resources and cultural heritage and threatens the community's long-term well-being. A participant stated, "Our natural resources are being destroyed. The new generations are the ones who are going to have to deal with the exploitation" (IND2). Both issues affect the community and societal levels.

Subtheme: Lack of Medications

A consistent medication shortage was identified as a pressing health issue, particularly affecting emergency services and controlled medications. This hinders the effective management of health conditions. One participant highlighted, "There is a lot of lack of medication. In the emergency area, there is a lot of medication shortage" (IND2). This issue impacts individual, community, and societal levels.

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this Page 13 of performint (which was not certified by peer review) is the approximation of the preprint in perpetuity.

It is made available under a CC-BY-NC-ND 4.0 International license .

281 Subtheme: Lack of Education Resources

Participants identified a shortage in the availability and quality of educational resources, exemplified by a
lack of schools and the underutilization of existing educational spaces. This lack of resources was seen as
a barrier to providing adequate education within the community. For instance, one participant stated,
"Everything that has to do with education, that is what we are looking for" (FG1). These insights reflect
significant concerns at the individual, community, and societal levels.

287 Subtheme: Loneliness in Some Individuals

Feelings of isolation and loneliness were identified as significant concerns for specific community
members, particularly during times of personal crisis. Loneliness affects mental and emotional wellbeing. For example, one participant noted that some patients like to come to the clinic to have company
"because many times they are alone, and what they want is to talk" (IND2). This reflects the individuallevel impact of social isolation.

293 Subtheme: Employment

A lack of diverse employment opportunities was highlighted as a significant issue, especially for the youth. The local economy offers limited career paths, forcing individuals to migrate or accept employment outside their desired professions. A participant explained, "For young people, there are not many [options out] there; what we have are the same [jobs] in a restaurant, but there is no way that if someone wants to be a lawyer, there is no way. There are not many alternatives for work" (FG1). The decline in the available labor force, mainly due to an aging population, was seen as a challenge in maintaining essential services. This sense of vulnerability affects those who are aging or ill. This issue impacts the individual, community and societal levels.

302 Theme 2 (T2): The Role of Community Health Workers

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this preprint (which was not certified by peer review) is the amagin for the approximate medRxiv a license to display the preprint in perpetimage 14 of 27

> Community Health Workers are vital in enhancing healthcare access and quality for individuals in underserved communities (Table 3). They provide essential support by assisting with patient education, scheduling medical appointments, managing medications, and offering companionship during medical visits. Their involvement improves health outcomes and fosters a sense of trust and comfort among patients, significantly impacting their overall healthcare experience. However, most people do not fully understand CHWs' role, even though some might already have been in contact with CHWs before. Therefore, it is essential for people to know what CHWs can do for them to improve their healthcare access.

311 Subtheme: Assists and Guides the Patient

Participants highlighted the vital role of CHWs in providing valuable assistance and guidance. CHWs help patients understand their health conditions and learn how to manage their treatments, improving their autonomy and care. One participant noted, "They guide you, give you information so you know what these symptoms are based on, and how to take care of yourself" (FG103). Another shared, "They have taught me how to inject insulin. I have done it, but I have had several doubts. And they clear up my doubts" (IND39). These interactions enhance the interpersonal relationships between CHWs and patients, fostering trust and confidence.

0 319 Subtheme: Helps Schedule Appointments with Specialists

320 CHWs play a crucial role in helping patients schedule appointments with specialists, ensuring continuous 321 and specialized care, especially for chronic conditions. A participant explained, "If I needed such an 322 appointment with the specialist, find me one. When I need a referral, what I do is that I go with the 323 community health worker, we interconnect, and things seem to move a little faster; that's why it's 324 important" (IND2). This assistance is essential in maintaining the continuity of care and addressing the 325 specific health needs of patients. medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this Page 15 of paperint (which was not certified by peer review) is the approximately approximately and the preprint in perpetuity.

It is made available under a CC-BY-NC-ND 4.0 International license .

Subtheme: Assists in Medication Management The support provided by CHWs in medication management is seen as crucial, particularly for those who struggle with maintaining their medication regimens. One participant stated simply, "They get the medicines for me" (IND59). This service is essential for ensuring that patients adhere to their prescribed treatments and manage their health conditions effectively. Subtheme: Trust and Social/Health Support Participants valued the accompaniment provided by CHWs when accessing medical facilities. This support offers comfort and confidence, particularly when patients need to access laboratory services or return home. One participant shared, "And I have a lot of confidence in her when I have to go to the laboratory. She waits for me patiently. She takes me home" (IND59). This accompaniment helps reduce the stress and anxiety associated with medical appointments, contributing to better health outcomes. **Subtheme: Provides Comfort and Confidence** CHWs are recognized for their attentive and considerate care, which instills comfort and confidence in patients. As one participant expressed, "They gave me comfort" (IND49). This emotional support is essential to the healthcare experience, helping patients feel more secure and supported in managing their health. By offering these services, CHWs play an integral role in improving healthcare delivery and outcomes, particularly in underserved communities. Their work addresses both the practical and emotional needs of patients, fostering a more supportive and effective healthcare environment. Theme 3 (T3): Telehealth Services Participants expressed different perspectives towards the THS Services in providing healthcare access in rural and underserved communities for chronic disease management (Table 4). Some participants Support: prosupport@liebertpub.com

believed that THS could offer numerous benefits, including reducing the need for transportation, saving
time and costs, and ensuring continuity of care when in-person medical visit options aren't available or
accessible. However, THS also faces challenges such as perceived inconvenience compared to in-person
visits, lack of knowledge among users, and concerns about data privacy. Despite these challenges, THS
was seen as a beneficial alternative when traditional healthcare options are inaccessible, enhancing overall
healthcare experiences by offering peace of mind and improved communication between patients and
providers.

355 Subthem

Subtheme: Less Convenient than In-Person Care

Participants identified concerns about the convenience of remote healthcare services compared to inperson visits, especially highlighting the value of physical exams and the personal touch of face-to-face
consultations. One participant stated, "In-person visits are more convenient" (IND39). This underscores
the interpersonal challenge of remote healthcare services.

360 Subtheme: Assistance During the Pandemic

The crucial role of THS services during the pandemic was emphasized, providing necessary support and care in challenging times, significantly when traditional services were disrupted. A participant noted, "It was a great moment. And if you come to apply it in the case of Culebra, it would be phenomenal, too. I would want to have a doctor all the time, but if I have no other option, well, it's great that this option is there" (IND2). This highlights the community and societal benefits of THS during crises.

5 366 Subtheme: A Good Alternative When No Other Option is Available

367 Participants viewed THS services as beneficial alternatives when in-person care is inaccessible, mainly
368 due to transportation issues. One participant shared, "I don't know about anyone else, but I do. I prefer a
369 doctor on camera than none at all" (IND39). This demonstrates the individual, community, and societal
370 advantages of having THS as an option.

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this Page 17 of perform (which was not certified by peer review) is the approximation of performance of the preprint in perpetuity.

It is made available under a CC-BY-NC-ND 4.0 International license .

371 Subtheme: Lack of Knowledge

372 More knowledge about THS services and procedures still needs to be provided, which may prevent

373 individuals from fully utilizing them. A participant admitted, "I haven't done it yet" (IND49). This reflects

374 the individual-level challenge of awareness and education regarding THS.

375 Subtheme: Independent of Transportation

376 The advantage of THS services not requiring transportation was particularly noted as useful for

377 communities with limited access to transportation. One participant explained, "In bad weather that there is

378 no transportation which cannot come, then that would be a good alternative" (IND39). This benefit spans

379 community and societal levels.

380 Subtheme: Time and Cost Savings

Participants identified significant time and cost savings with the use of remote or THS services,
eliminating the need for travel and reducing the opportunity cost of seeking medical care. One participant
stated, "These trips would actually waste money and time" (FG103). Another noted, "It saves a lot of time
because the kids don't have to miss school. It's a whole lost day" (IND1). These points highlight the
individual and community benefits of THS.

386 Subtheme: Privacy Issues-Improper Disclosure of Personal Information

387 Concerns were raised about the potential for improper disclosure of personal information when using
388 remote services, which may deter some from utilizing these services. A participant expressed, "There are
389 also many people who do not like to give "[their]" data over the phone. There have been many hackers"
390 (IND49). This concern affects individual, interpersonal, community, and societal levels.

391 Subtheme: Rejection by Older or Technologically Challenged Individuals

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this preprint (which was not certified by peer review) is the away frames is the away frames in the preprint where the preprint is the away frames is the preprint of the preprint is the preprint in perpetident of the preprint of the preprint is the preprint of the preprint o

It is made available under a CC-BY-NC-ND 4.0 International license .

Participants identified that older individuals or those who are less technologically savvy may resist using
remote healthcare services due to unfamiliarity with technology or a preference for traditional in-person
care. One participant's opinion was, "Because sometimes there are many elderly people, they don't know
technology" (IND49). This reflects the individual and community challenges in THS adoption.

396 Subtheme: Trust Depends on the Type of Medical Examination

397 Trust in the THS varies depending on the type of medical examination required. For visual assessments or 398 follow-ups, remote consultations may suffice, but for more tactile, in-depth examinations, in-person visits 399 are preferred to ensure safety and accuracy. One participant remarked, "The decision depends on whether 400 it is a follow-up consultation or if it is the first time with the specialist. If it is an evaluation or, if they 401 need to do a laboratory check, and if they are going to do a study later. Therefore, people should go in 402 person" (FG103). This indicates the individual-level trust considerations.

403 Subtheme: Peace of Mind

Having healthcare consultations in the comfort of their own home provides patients with peace of mind. It
allows them to communicate more effectively, ensuring they remember to discuss all their concerns with
the doctor. A participant shared, "Yes, I sit in my room and explain everything to him. Sometimes, you go
to see the doctor, and you forget the things that you had to tell him" (IND59). This benefit is significant at
the individual level.

409 DISCUSSION

410 Our findings suggest that the integration of THS with the support of CHWs was perceived positively by 411 the community as an effective approach to improve access to healthcare for those with chronic diseases 412 living in rural settings. Participants indicated that CHWs can positively impact some identified SDoH, 413 such as transportation challenges, particularly on the island, where a golf cart or a clinic official vehicle 414 was proposed to offer patients transportation to and from the clinic. However, it is essential to note that medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. some of these structural determinants include economic instability and geographical isolation, which are beyond the scope of CHWs alone. This study found that the community perceived THS) along with the support of CHWs, as a positive sign to improve access to healthcare. Moreover, participants' perspectives confirmed that an intervention of CHWs-assisted THS can reduce the lack of specialized healthcare access for patients living in rural settings. The integration of CHWs and THS can help mitigate barriers related to transportation, provide timely medical consultations, and offer continuous support for managing chronic conditions. The combination of technology and personalized care from CHWs can foster trust and enhance patient engagement, leading to better health outcomes.(26) The SEM served as a theoretical framework that helped us better understand the impact of interventions using technology, such as THS, whether used alone or assisted by CHWs. SEM allowed for a comprehensive analysis of how individual, interpersonal, community, and societal factors interact to influence health outcomes. We were able to identify people's perspectives towards the potential integration of CHWs and THS to solve the challenges of healthcare access. Results suggest that CHWs can provide comfort and trust to patients, assist with patient education, schedule medical appointments, manage medications, and offer companionship during medical visits. On the other hand, THS could solve health access challenges, including the time-saving and cost-effectiveness of medical appointments, transportation independence, and a more accessible tool for better chronic disease management. The results confirm that this framework helps to better understand the perspectives and attitudes of people toward integrating CHWs and the THS model for chronic disease management in rural areas. Findings from the present study confirm participants' challenges and perceptions toward CHW and THS. We found that these two evidence-based models can be and should be implemented in rural and underserved areas as part of an equitable model for healthcare. However, while CHWs and THS show promise in addressing certain SDoH and improving healthcare access in rural areas, addressing the

medRxiv preprint doi: https://doi.org/10.1101/2024.11.13.24317260; this version posted November 13, 2024. The copyright holder for this preprint (which was not certified by peer review) is the approximately function of the preprint in perpetide and the preprint in perpendence and the pre

broader structural determinants requires systemic changes and policy interventions. Future efforts should
enhance THS infrastructure, increase community health literacy and willingness, and support CHWs
(training) to ensure sustainable and equitable healthcare solutions for rural and isolated populations. By
leveraging the strengths of both CHWs and THS, we can move towards a more integrated and effective
approach to reducing health disparities and improving the overall health of communities like Culebra.

From a health equity perspective, the findings also inform strategies to address similar issues in other countries, particularly in rural island communities. These communities often face unique challenges such as geographic isolation, limited healthcare resources, and higher vulnerability to health disparities. Previous studies have shown that CHWs can help navigate health services for Latinx communities who face challenges such as limited resources during COVID-19.(27) Studies have also demonstrated THS as a powerful tool for routine provision of care for Latinos. (28) However, non-previous studies have integrated both CHWs and THS to use them together. By adopting the evidence-based models of CHWs and THS, rural island communities can improve healthcare access, enhance health education, and build sustainable healthcare systems. This can lead to better health outcomes and reduced health disparities, ultimately benefiting communities like Culebra and similar rural island populations globally.

454 Study Limitations

The qualitative findings are based on subjective self-reported data, which participants' personal biases may influence. This study was limited by factors that could influence participant's perceptions and experiences, including prior healthcare experiences, individual health literacy, and personal attitudes toward technology and healthcare providers.
