25

26 **Abstract** (word count: 349)

27

28 **Background**

29 The measurement of cause-specific mortality is critical for health system planning but remains a
30 challenge in many low-resource settings due to societal, legal, and logistical barriers. We
31 present a co-development process with community members for the design and implementation
32 of an autopsy program to improve cause of death data in a historically underserved population.

33

34 **Methods**

35 We sought to develop an autopsy program at the Africa Health Research Institute (AHRI) Health
36 and Demographic Surveillance Site (HDSS). The project proposes to obtain consent from
37 families of deceased adults, to perform diagnostic autopsies by a trained pathologist, and to
38 process samples to determine causes of death. Prior to launching the program, we engaged key
39 partners in learning their perspectives about such a program and understanding the landscape
40 of challenges needed for successful implementation. Herein, we describe lessons from
41 interactions with these partners, including 1) the AHRI community advisory board (CAB), 2) the
42 South Africa Department of Health (SA DoH), 3) local traditional authorities, 4) funeral home
43 personnel, 5) traditional healers, and 6) healthcare providers. We also detail the development of
44 community outreach efforts used to inform the public about the program.

45

46 **Results**

47 The partners provided valuable feedback on the study design and informed us of issues that
48 needed to be addressed: community concerns about organ retention and sale (CAB),
49 implications of how autopsy findings could spur litigation and erode trust in healthcare providers
50 who determined alternate causes of death (SA DoH), a cultural practice that conflicts with the
51 autopsy procedure (traditional healers), the need to educate families before they engage with

52 funeral businesses (funeral homes), and enhancing our death referral network through
53 healthcare providers. This led to protocol changes and an adapted community engagement
54 strategy, which included educating healthcare providers, hosting community dialogs,
55 broadcasting radio advertisements, and developing a film to describe autopsy procedures to
56 families considering participation.

57

58 **Conclusions**

59 We present a comprehensive model of partner engagement for a community-based autopsy
60 program in South Africa, leading to the co-development of a program that incorporates local
61 customs around death while promoting buy-in and support from the government, civil society,
62 and medical partners.

63

65

66 **Introduction**

67 Accurate identification of the leading causes of death is crucial for effective health system
68 planning and resource allocation. In rural South Africa, as in other low- and middle-income
69 countries, the collection of accurate mortality data is limited by a scarcity of postmortem data.(1)
70 Modeling studies such as the Global Burden of Disease Study, which use risk factors to
71 estimate mortality in areas with limited data, suggest that HIV/AIDS is a leading cause of death
72 in the country.(2) Yet, more recent data suggest that this trend may be changing.(3) The
73 widespread adoption of antiretroviral therapy has led to a notable decline in deaths due to
74 HIV.(3) However, the leading causes of death emerging from this epidemiological shift remain
75 obscure, largely due to incomplete or inaccurate death registries that do not reflect directly
76 measured causes of mortality.(4, 5)

77

78 In settings where cause-of-death information is limited and where most deaths occur outside
79 healthcare facilities, verbal autopsy has emerged as a common method for determining
80 population-based, cause-specific mortality.(6) Verbal autopsies are used by multiple
81 demographic health and surveillance sites and have been shown to have favorable validity for
82 accidents, trauma, and infectious disease causes of death.(7) However, for deaths related to
83 cardiovascular disease or cancer, verbal reports have poor sensitivity and specificity,
84 particularly in settings where diagnostic infrastructure for those conditions is lacking.(7)

85

86 To address this knowledge gap, we are developing a pathologic autopsy program within a rural
87 Health and Demographic Surveillance Site (HDSS) in KwaZulu-Natal, South Africa,
88 encompassing 150,000 individuals. The objectives of the pathologic autopsy program are 1) to
89 determine the leading causes of death among adults in rural KwaZulu-Natal in the era of
90 widespread antiretroviral therapy availability and declining HIV mortality(8, 9); 2) to evaluate the
91 validity and determine the optimal use of verbal autopsy-based tools; and 3) to provide the

92 health department with high-quality cause of death and burden of disease data to inform policy.
93 Although complete diagnostic autopsies are considered the gold standard for determining the
94 cause of death, such practices have been historically challenged in resource-limited settings
95 due to the lack of histologic laboratory infrastructure and skilled personnel.(6) Our initiative in
96 South Africa aims to overcome these challenges by leveraging a robust research infrastructure,
97 including diagnostic testing, tissue storage, and the expertise of trained pathologists and
98 prosecutors, in partnership with a longstanding HDSS survey with comprehensive risk factor
99 data.(10, 11)

100

101 In preparation for the introduction of this program, we met with a diverse set of public, civil
102 society, and medical stakeholders to learn about preferences for and challenges to its
103 implementation. We recognized the many cultural and religious beliefs that often pose
104 challenges to conducting postmortem examinations, which involve complex discussions with
105 family members after the loss of a loved one and examination of the external and internal body
106 with invasive sampling to obtain tissue for microscopy.(6) In South Africa, many sociocultural
107 barriers to autopsy, such as gendered power dynamics, traditional and religious belief systems,
108 and a lack of trust in the healthcare system, have been reported.(12) Herein, we describe
109 feedback provided by program partners that we hope will offer insights into the establishment of
110 autopsy programs in similar contexts.

111

112 **Methods**

113 **Study Setting**

114 This work was conducted at the Africa Health Research Institute's (AHRI) Health and
115 Demographic Surveillance Site embedded within the Hlabisa subdistrict of KwaZulu-Natal,
116 South Africa. Since the initiation of AHRI's verbal autopsy program, we have observed over
117 2,550,000 person-years and recorded over 24,000 deaths.(13) Annual household surveys

118 capture data on migration, household wealth, use of healthcare services, and clinical testing for
119 prevalent diseases such as HIV, tuberculosis, hypertension, and diabetes. The population
120 remains one of the world's most intensely HIV-affected regions, with more than 34% of the
121 population living with HIV.(10) Due to tremendous public health efforts that have increased
122 access to antiretroviral therapy, more than three-quarters of those with HIV have controlled
123 disease with suppressed viral loads.(9) Most residents live beneath the South African poverty
124 line in rural or peri-urban areas, with an overall life expectancy of 56.1 years.(14) Within this
125 community, medical pluralism is common, and many individuals consult traditional healers
126 before seeking care at Department of Health facilities.(15, 16)

127

128 **Initial Proposed Autopsy Study Design by the Research Team**

129 The outline of a community-based pathologic autopsy program was presented to members of
130 the community and was iteratively refined (**Figure 1**). Eligible participants for the autopsy study
131 include deceased residents of the HDSS aged 18 years or older. The pathologic autopsy
132 program would be offered to families of all deceased adults who meet eligibility criteria.
133 Recruitment would be facilitated through funeral homes. Upon notification of a death from the
134 funeral home or interested family, the project coordinator would contact the family and establish
135 an in-person meeting to discuss the study. Informed consent would be obtained from the next of
136 kin in accordance with the South African National Health Act (17) at a location chosen by the
137 family, which could be the funeral home or the family's residence.

138

139 **Figure 1: Collaborative Framework for Protocol Development and Implementation.**

140 This diagram outlines the comprehensive approach taken by the research team at the Africa
141 Health Research Institute (AHRI). It highlights the initial proposal design with the Department of
142 Health, University KwaZulu-Natal Biomedical Research Ethics Committee, and the community
143 advisory board. It then shows progression through the extensive community and institutional

144 engagement process involving traditional authorities, funeral homes, healthcare workers, civic
145 society, the police department, environmental services, and forensic pathology. The figure
146 illustrates the iterative process of refining protocols, informed consent, and educational
147 materials through pilot experiences with families and community partners.

148

149 **Additional proposed study procedures**

150 Following receipt of informed consent from the family, the study pathologist would perform the
151 autopsy at the affiliated funeral home, adhering to any family requests regarding the extent of
152 the procedure or specific organ sampling for analysis. Tissue processing and storage would be
153 performed at AHRI's laboratory in Durban. Families would receive autopsy results after 12 to 16
154 weeks, which include the most likely cause of death and contributing causes. A verbal autopsy,
155 which occurs at 12 weeks after a death within the HDSS protocol, would then be conducted at a
156 separate time with the closest relative before disclosure of the final pathologic autopsy results.

157

158 **Partner Engagement Methods for Iterative Refinement of the Autopsy Study**

159 This study was designed to incorporate the perspectives and expertise of diverse groups,
160 including the Africa Health Research Institute's Community Advisory Board (CAB), the
161 University of KwaZulu-Natal's Biomedical Research Ethics Board (BREC), the Department of
162 Health officials, local traditional authorities, funeral home personnel, traditional healers, the
163 South African Police, Civil Society community leaders, and healthcare providers associated with
164 AHRI and the Department of Health.

165

166 Our engagement approach varied by partner type to maximize accessibility and participation.
167 The AHRI Public Engagement Team facilitated meetings with key partners such as traditional
168 authorities, the Department of Health, and civil society leaders. Our engagement with traditional
169 healers was facilitated by the Traditional Medicine Faculty at AHRI. For funeral home

170 engagement, we conducted a comprehensive search to identify every funeral home within the
171 region, followed by in-person appointments with each facility.

172

173 Recommendations for key concepts to address and findings from each partner, as well as
174 resulting protocol adaptations made in response to their input, are summarized below and in

175 **Table 1.**

176

177 *Africa Health Research Institute's Community Advisory Board (CAB)*

178 We initiated our engagement process by conducting meetings with the Africa Health Research
179 Institute's Community Advisory Board (CAB), an official oversight body that evaluates study
180 designs in parallel to the Biomedical Research Ethics Committee (BREC). The CAB, which
181 convenes monthly, plays a pivotal role in representing community interests and ensuring ethical
182 research practices. The 25 members are elected every three years and receive comprehensive
183 three-day training on roles, responsibilities, and AHRI's research activities. The CAB enables
184 community members to express any questions or concerns about the institute's research prior
185 to and throughout the duration of community-based projects.

186

187 The CAB was instrumental in educating our research team about various cultural, traditional,
188 and community norms that could influence engagement with the autopsy program. They brought
189 to our attention considerations about local beliefs, such as ukuthakatha or witchcraft, and how
190 they might intersect with our research objectives. For example, if a person was believed to have
191 been the target of witchcraft, family members may seek information about how it may have
192 contributed to the participant's demise. We addressed this concern by including language in our
193 consent forms and study information materials that the procedure would only detect the medical
194 diagnoses that may have contributed to death.

195

196 The CAB was supportive of the study's objectives. However, they emphasized the need to time
197 autopsy procedures considering local burial customs, which typically occur within a week of
198 death. Acknowledging this, we ensured that our consent process explained that we would strive
199 to accommodate the time-sensitive burial proceedings and that families may want to decline if
200 there was a risk that it would delay burial plans. We also clarified that there would be no
201 additional costs to the family if they chose to wait until the autopsy procedure could be
202 completed before burial. Additionally, the CAB members raised a common misconception that
203 forensic pathologists remove all organs during autopsies and replace them with cotton, which
204 conflicts with the local tradition of burying a person "whole".(12) We proactively addressed this
205 by clarifying that we do not replace organs with cotton or remove full organs in our community
206 outreach methods. Finally, the CAB helped us refine communication strategies, such as the
207 wording used in radio broadcasts and other public communications, to ensure a high degree of
208 cultural sensitivity (**Figures 2,3**).

209

210 **Figure 2: Participant-facing flyer for Study Outreach and Engagement. (English version)**

211 This flyer, designed by the Africa Health Research Institute's Pathologic Autopsy Research
212 Program, is addressed to families who may be left with questions after a family member is
213 deemed to have died from natural causes. It raises awareness about the autopsy program goals
214 and invites community members to seek more information through the contact details for the
215 program coordinator.

216

217 **Figure 3: Educational Flyer for the Pathologic Autopsy Program (English version)**

218 This poster explains the concept, purpose, and process of a pathologic autopsy. It addresses
219 common questions raised by our community partners. A diagram illustrates the step-by-step
220 procedure and concludes with the contact information of the study coordinator.

221

222 *University of KwaZulu-Natal's Biomedical Research Ethics Board (BREC)*

223 The Biomedical Research Ethics Board provided ethical review of our protocol and consent
224 forms. Feedback from this group resulted in our study adopting a separate consent form for
225 tissue storage and future use of biological samples. Additionally, to ensure compliance with
226 confidentiality standards, the input from the ethics committee led us to establish an independent
227 consent process for collecting contact information from potentially eligible and interested
228 families at the funeral homes. To do so, we created a document capturing the name and contact
229 information of an interested family member, which was provisioned in each of the funeral home
230 businesses. We were also asked to provide our study personnel with specialized training in 1)
231 ethical consent practices for the recruitment of recently bereaved families and 2) the
232 management of emotional stress among study staff. The training was provided by the staff
233 psychologist at AHRI psychologist. Standing team debriefing sessions with the verbal autopsy
234 nurses and pathologic autopsy nurse were scheduled.

235

236 *Department of Health*

237 Discussions with the Department of Health were crucial to align the study procedures with local
238 health regulations. During these meetings, district and provincial officials were consulted to
239 delineate the scope of our autopsies, ensuring that they were clearly defined as examinations
240 for natural causes of death and thus would not interfere with forensic pathology services, which
241 are legally mandated for deaths suspected to be unnatural.(18) Natural deaths are defined as
242 deaths related to internal bodily events not influenced by external occurrences, such as suicide,
243 homicide, or trauma. Furthermore, if the study pathologist identified findings concerning an
244 unnatural death, the deceased would be immediately transferred to police custody as
245 sanctioned by the Department of Health. This change was adapted to our protocol as well as to
246 AHRI's Memorandum of Agreement with the Department of Health.

247

248 Several additional unforeseen concerns also surfaced in discussions with the Department of
249 Health. For example, they queried whether autopsy results could be used in legal action against
250 healthcare providers for misdiagnosis or medical negligence, particularly if a patient was treated
251 for one disease, such as tuberculosis, but was later found through autopsy to have died from a
252 different disease process. We addressed this issue by clarifying the scope of the study,
253 emphasizing that the primary aim is to advance medical understanding and not to provide
254 evidence for malpractice litigation. We also revised our communication and consent documents
255 to state that the clinical research findings should not be used in a court of law to ensure that
256 participant families were not engaging in this research program for purposes of litigation. We
257 reinforced the role of autopsies in improving diagnostic accuracy and healthcare quality,
258 underlining that the study would ultimately strengthen the community's health system by
259 providing insights into disease patterns.

260

261 *Community Police Forum*

262 Discussions with the police force informed our team of the appropriate referral pathways for
263 unnatural death reporting. Although participants are only eligible for our study if they are
264 deemed to have died from natural causes, there may be potential cases where the study
265 pathologist identifies findings suspicious for an unnatural cause of death. We learned the
266 necessary steps needed to transfer the participant to police jurisdiction and amended our
267 protocols to account for this possibility.

268

269 *Local Traditional Authorities*

270 In KwaZulu-Natal, the endorsement and support of local traditional chiefs are prerequisites for
271 community-based research, but particularly for studies addressing sensitive topics, such as
272 postmortem examination. We approached local chiefs to obtain their input and advice on our
273 study design. In our meetings, we described the study's objectives, potential benefits to the

274 community, and the approach we would adhere to regarding cultural practices surrounding
275 death. Through open dialog and answering their questions, we received their approval to
276 proceed.

277

278 *Funeral Home Collaboration*

279 We conducted a series of face-to-face conversations with funeral home managers and staff,
280 which revealed insights that influenced our outreach and operational strategies. Initially, these
281 dialogs aimed to explore the potential for partnership and gauge the level of interest in the
282 study. However, as discussions progressed, funeral home managers expressed concern about
283 being the primary point of contact for families to learn about the autopsy study. They stressed
284 the need for the research team to proactively educate the community to alleviate the burden on
285 funeral home staff of conveying sensitive information about autopsy practices. This feedback led
286 to a strategic shift in our approach, prioritizing direct community outreach to introduce the study
287 and its objectives before family engagement with funeral services.

288

289 Furthermore, funeral home managers were apprehensive about the legal implications of
290 conducting autopsies on their premises. To address these concerns, we sought approval to
291 perform autopsies within legally licensed funeral homes from representatives of the Department
292 of Health Forensic Pathology Division and the Department of Environmental Services.

293 Additionally, we learned that among the 17 funeral home businesses in the region, the majority
294 shared resources, with three common morgues used collectively between them. To formalize
295 the collaboration, we developed a contract with each funeral home, detailing the relationship
296 between AHRI and the funeral home entities. No financial incentives were offered to the funeral
297 homes to ensure ethical integrity and prevent the coercion of program participation. Instead, we
298 opted to rent morgue space at the standard rate, a cost equivalent to what smaller funeral
299 businesses would incur when utilizing the morgues of larger establishments.

300

301 Through these engagements with funeral home staff, it became evident that, whereas there was
302 an interest in medical causes of death, they felt most families seeking autopsies did so under
303 the suspicion of unnatural causes, such as poisoning, witchcraft, or foul play. This distinction
304 was important in tailoring our communication and consent processes to ensure that families
305 were in line with our study goals to determine the natural causes of death in the community.

306

307 *Traditional Healers*

308 Recognizing the influential role of traditional medicine in the community's healthcare decisions,
309 we engaged with traditional healers to seek their impressions and insights into an autopsy
310 program. The traditional healers taught us more about the local community practice of
311 ukushashazela, in which families perform a ritual involving the slaughter of a goat to “close the
312 wounds” for a relative buried without all organs or tissues.(19) The traditional healers advised
313 that autopsies could be culturally accepted if provisions for ukushashazela were available to
314 families who practice it. Considering this, we refined our autopsy communication and consent
315 processes to mention such cultural practices. After addressing their concerns and providing
316 detailed explanations about the study, we sought support from traditional healers in
317 recommending autopsies to appropriate families, with confidence that our procedures would be
318 respectful of local customs.

319

320 *Healthcare Providers*

321 We also conducted a series of group discussions and educational sessions with nurses,
322 community healthcare workers, peer navigators, and physicians affiliated with AHRI and the
323 Department of Health. This included engagement with 231 healthcare providers affiliated with
324 11 primary health care clinics and the district referral hospital. These sessions served to inform

325 healthcare professionals about the study procedures, answer any queries, and encourage them
326 to refer interested families who met the criteria to our study team.

327

328 *Civil Society Leaders*

329 Within the uMkhanyakude district, civil society meetings include diverse representations of
330 community leaders. These include members from the Department of Health, social workers,
331 Non-Governmental Organization (NGO) representatives, and District and Local AIDS Council
332 members. These meetings served to further disseminate the objectives of the pathologic
333 autopsy study and receive approval for study implementation.

334

335 **Community Engagement and Outreach**

336 The above partner meetings helped to inform a comprehensive community outreach and
337 sensitization plan. Goals for the program included informing the public about 1) the value of
338 cause of death determination both individually and for the community; 2) the steps, nature, and
339 timing of autopsy procedures; and 3) contact information for interested parties. We
340 disseminated the program in the following ways:

341

342 *Entertainment-Education Road Shows*

343 The study team participated in the HDSS monthly road shows that combine education with
344 entertainment, a method that has proven effective in previous AHRI studies. These events
345 allowed direct interaction between the research team and members of the community,
346 facilitating a dynamic exchange of information. The road shows were designed to be engaging
347 and informative, covering specifics of the autopsy study procedures, including data collection
348 processes and how results would be disclosed to participant families.

349

350 *Radio Broadcasts*

351 To extend our reach across the HDSS community, we partnered with two local radio stations,
352 broadcasting a 30-second informational clip inviting listeners to tune into an hour-long program.
353 These sessions, led by the study's project coordinator in isiZulu, were scheduled regularly and
354 allowed us to address community questions in real time. Many of the questions reflected
355 community beliefs and concerns already raised during the CAB meetings.

356

357 *Community dialogs*

358 The Public Engagement Unit at AHRI conducts community dialogs in isiZulu to address myths
359 and concerns regarding research activities within the HDSS. The dialogs are scheduled to align
360 with the HDSS's surveys, targeting areas where surveys are to be conducted the following
361 week. Although all community members from these areas are invited to participate, typically
362 only 10-20 members attend the discussions, along with the project coordinator from the
363 Pathologic Autopsy Program. These gatherings take place in accessible outdoor spaces or
364 homesteads. The number of dialogs held is contingent upon the size of the area and the nature
365 of the concerns raised, ranging from two to three sessions.

366

367 *Verbal Autopsy Infrastructure*

368 We leveraged the existing verbal autopsy infrastructure for reporting demographic events. For
369 example, any individual may call AHRI to report births, deaths, migrations, etc., within the
370 HDSS. Individuals who report these events to the AHRI call center are offered airtime
371 reimbursements, ensuring that the cost does not hinder communication. We integrated the
372 pathologic autopsy program into this established system to enable more rapid notification by our
373 project coordinator. Our coordinator would then reach out to the notifying individual and contact
374 the relatives with a recent death to inform them about the autopsy study and assess eligibility.
375 This enabled more targeted information sharing to families who may be interested in the
376 autopsy program.

377

378 *Dissemination of Autopsy Program Educational Adverts*

379 Our outreach materials included flyers and posters (**Figure 2, Figure 3**). Flyers are distributed
380 to the community at the Department of Health clinics, community events, and funeral homes.
381 Posters, which more comprehensively detail the autopsy process, were strategically placed
382 within funeral homes to educate and inform visitors.

383

384 **Video-Based Consent Process**

385 We planned to obtain consent through in-depth face-to-face discussions, ensuring that families
386 were well informed before participation. We developed a consent video presented in isiZulu,
387 featuring the project coordinator, the Community Advisory Board Chair, the study pathologist,
388 and the study prosector. This five-minute video (**Supplemental 1**) proved to be a crucial tool for
389 clearly explaining the study's goals, the pathologic autopsy and verbal autopsy components,
390 and the tissue storage process in our pilot trial. The film's effectiveness in conveying complex
391 information succinctly made it an invaluable asset not only during the consent process but also
392 during partner meetings.

393

394 **Feedback from individuals with recently deceased family members who declined** 395 **participation.**

396 As community knowledge about the autopsy program increased, several families were referred
397 to discuss the procedure. Initially, the first 10 families declined to consent for autopsy. Reasons
398 for declined enrollment included the following: 1) a death certificate had already been issued,
399 and the family was content with the diagnosis; 2) the timing of the autopsy procedure, which
400 was conducted weekly on Mondays or Tuesdays by our study pathologist, did not align with the
401 funeral ceremony preparations; 4) family members were not the next of kin, or they requested
402 permission and consensus from others; and 5) the return of results 12-16 weeks later was

403 deemed untimely. To address these barriers, we modified our study approach. For example, we
404 partnered with a private physician in the community responsible for completing death certificates
405 to add preliminary data found on autopsy examination to the death forms. We have expanded
406 the number of days the study pathologist is available to conduct autopsies to facilitate family
407 preferences for funeral proceedings and funeral home obligations. Finally, in our protocol, we
408 sought written consent from the designated next of kin but strongly encouraged the consensus
409 of the entire family to maximize joint decision making.

410

411 **Discussion**

412 This work highlights the importance of community engagement and partner feedback in the
413 establishment of a community-based pathologic autopsy program within rural South Africa.
414 Proactive and culturally sensitive strategies, codeveloped with community members and civic
415 leaders, are requisite in areas where autopsies are not commonly conducted due to
416 sociocultural, religious, and logistical barriers. Our meetings with partners provided a number of
417 key insights, such as the need for referral pathways that are independent of funeral homes,
418 educational materials that address concerns among community members, the need to integrate
419 a multistep process to confirm family motivations for pursuing autopsy without suspected foul
420 play, the need to ensure the alignment of autopsies with traditional practices (in our case with
421 that of ukushashazela), and the ability to provide flexibility for when the procedure is conducted
422 to align the procedure timing with planned funeral proceedings.

423

424 This work was motivated by reports from the region about hesitancy surrounding
425 pathologic autopsy procedures. For example, research in Tanzania found that community
426 attitudes toward autopsies were influenced by beliefs about witchcraft and concerns regarding
427 the disturbance of the body after death, akin to feedback raised during our partner
428 interviews.(20) In Zambia, one study demonstrated that families often decline neonatal

429 autopsies, with 43% citing them as futile since the diagnosis should have occurred prior to
430 death, rendering postmortem findings of no benefit.(21) Additionally, more than one-quarter of
431 those who refused did so because a death certificate had already been issued and
432 arrangements to transport the body had been made and could not be delayed.(21) In contrast, a
433 study conducted across Gabon, Kenya, Mali, Mozambique, and Pakistan found that interviews
434 with family members in the first 24 hours after death were easier to conduct than those at later
435 stages.(22) This group also found that the acceptability of an autopsy program required
436 early community education and staff preparedness to be able to appropriately address
437 emotional trauma and grief while ensuring a comprehensive consent process. Based on this
438 information, we sought to meet early and often with relevant community members to understand
439 and address concerns they may have and seek solutions to garner support.

440
441 Our experience provides a roadmap for researchers and healthcare practitioners aiming to
442 implement similar community-based pathologic autopsy programs in other settings. We took
443 away three key lessons from our program development through engagement with a diverse set
444 of community members, including the Department of Health, local traditional leaders, community
445 advisory boards, the police force, civic society members, healthcare workers, and funeral home
446 personnel. First, engaging with community members to understand cultural beliefs and
447 misconceptions about autopsy is an instrumental first step. While other studies have explored
448 perspectives from the relatives of recently deceased persons, (22-26) we started by holding
449 group discussions with community members not currently experiencing bereavement to gain an
450 understanding of traditional and cultural practices, appropriate messaging techniques, and delve
451 into the nuances of burial practices. Feedback indicated that the timing of the autopsy
452 procedures was critical. Aligning the study to accommodate local burial customs and family
453 preferences for funeral proceedings led to expanding the availability of the study pathologist and
454 adjusting the consent process to encourage family consensus. Furthermore, as autopsy

455 programs are not successful without input and buy-in from local traditional and civic society
456 groups, scientific modifications may be required after their perspective is gained. Our
457 experience underscores this point; adaptation of our communication and consent processes
458 was necessary after gaining a deeper understanding of ukushashazela. Incorporating this
459 cultural aspect in our approach helps ensure that the program is respectful of and responsive to
460 the values and beliefs of the community we aimed to serve.

461
462 Second, because the legal and regulatory frameworks governing postmortem examinations vary
463 significantly by country and jurisdiction,(27) meeting with legal experts and local health
464 authorities is essential to ensure compliance with autopsy procedures. We were first aware of
465 these legal requirements through funeral home engagements. Autopsy studies using funeral
466 home facilities have previously been met with challenges.(28) The private business owners
467 raised concerns about legal implications, which ultimately led us to formalize business
468 contracts, rent morgue space at standard rates, and engage with the Department of
469 Environmental Services to oversee facility compliance to ensure that the funeral home facilities
470 met standards for autopsy. We also engaged the Forensic Pathology Division of the Department
471 of Health and police force to ensure that our protocols aligned with the policies for unnatural
472 death referrals.

473
474 Finally, community sensitization is a prerequisite step ahead of community-based autopsy
475 programs. Promoting community buy-in requires transparent two-way communication about the
476 program's goals, processes, and potential benefits. We employed a multifaceted outreach
477 strategy with the goal of broadly reaching all members of the target population, including
478 entertainment-education road shows, radio broadcasts, community dialogs, and the use of
479 video-based consent processes. The use of video in the informed consent process for medical
480 research, including autopsy studies, offers notable benefits compared to traditional text-based

481 approaches. Video-based consent has been shown to lead to enhanced enrollment and greater
482 diversity among study participants.(29) This finding suggests that video consent can assist in
483 making complex medical information more accessible and understandable. For our autopsy
484 consent process, we provide a clear explanation of the procedures through video aids to dispel
485 misconceptions that could impede consent. The video details the procedure comprehensively
486 (albeit without images of a deceased person) and features key individuals such as the
487 pathologist and project coordinator to humanize and clarify the process for potential family
488 members. Additionally, by following an example family through the stages of the autopsy
489 process, the videos attempt to offer a relatable and transparent narrative that can be particularly
490 beneficial when overcoming language barriers or emotionally sensitive subject matter.

491

492 **Conclusions**

493 The establishment of a community-based pathologic autopsy program requires a
494 comprehensive community-engaged approach. By following this structured roadmap,
495 researchers can navigate the complexities of implementing similar programs, thereby enhancing
496 mortality data and informing public health strategies in underserved populations. Our experience
497 illustrates that with careful planning, respectful engagement, and adaptability, it is possible to
498 overcome barriers to implementing an autopsy program and contribute valuable insights into the
499 causes of death in communities where such data are scarce.

500

501 **Declarations**

502 **Ethics Approval and Consent to Participate**

503 This study received ethical approval from the Biomedical Research Ethics Committee (BREC) at
504 the University of KwaZulu-Natal (reference: BE290/16). The committee endorsed the publication
505 of our manuscript that reports feedback from stakeholder engagements as it aligns with the
506 approved protocols and enhances the social value of our work, with no further action required

507 from the Principal Investigator to obtain written informed consent before publication. Therefore,
508 written informed consent was not obtained from all stakeholder participants. This approach was
509 approved by the BREC under specific conditions that ensure compliance with ethical standards.

510

511 **Consent for Publication**

512 Written consent for publication of Supplemental 1 Consent Video was obtained from all
513 participants.

514

515 **Availability of data and materials**

516 Data sharing is not applicable to this article, as no datasets nor interview guides were generated
517 or analyzed during the current study.

518

519 **Competing Interests**

520 CI received grant funding from Gilead Sciences paid to his Institution for investigator-sponsored
521 research. CI received support from the International Vaccine Institute to attend the Indo-Pacific
522 Climate Resilience Forum. All other authors declare that they have no competing interests.

523

524 **Funding**

525 The pathologic autopsy program is funded by the Wellcome Leap Delta Tissue Program. This
526 research was also supported by the Fogarty International Center (D43 TW010543), National
527 Institute of Allergy and Infectious Diseases (T32 AI007433), and the National Heart, Lung, Blood
528 Institute (K24 HL166024) of the National Institutes of Health. This research and the HDSS are
529 funded in part by Wellcome (Grant number Wellcome Strategic Core award: 201433/Z/16/A)
530 and the DSI-SAMRC South African Population Research Infrastructure Network (SAPRIN). For
531 the purpose of open access, the author has applied a CC BY public copyright license to any
532 Author Accepted Manuscript version arising from this submission. The contents of this

533 manuscript are solely the responsibility of the authors and do not necessarily represent the
534 official views of the funders. The funders had no role in the conceptualization, design, data
535 collection, decision to publish, or preparation of the manuscript.

536

537 **Authors' contributions**

538 GS, AC, TN, and NG conducted the partner engagement and community outreach activities.

539 GS, AC, TN, AG, EW, CI, KH, AS, and MS contributed to the design of the study. AS obtained
540 funding for the program. All the authors have read and approved the final manuscript.

541

542 **Acknowledgments**

543 The authors would like to thank all the community partners and families who provided their
544 feedback on the development of this study.

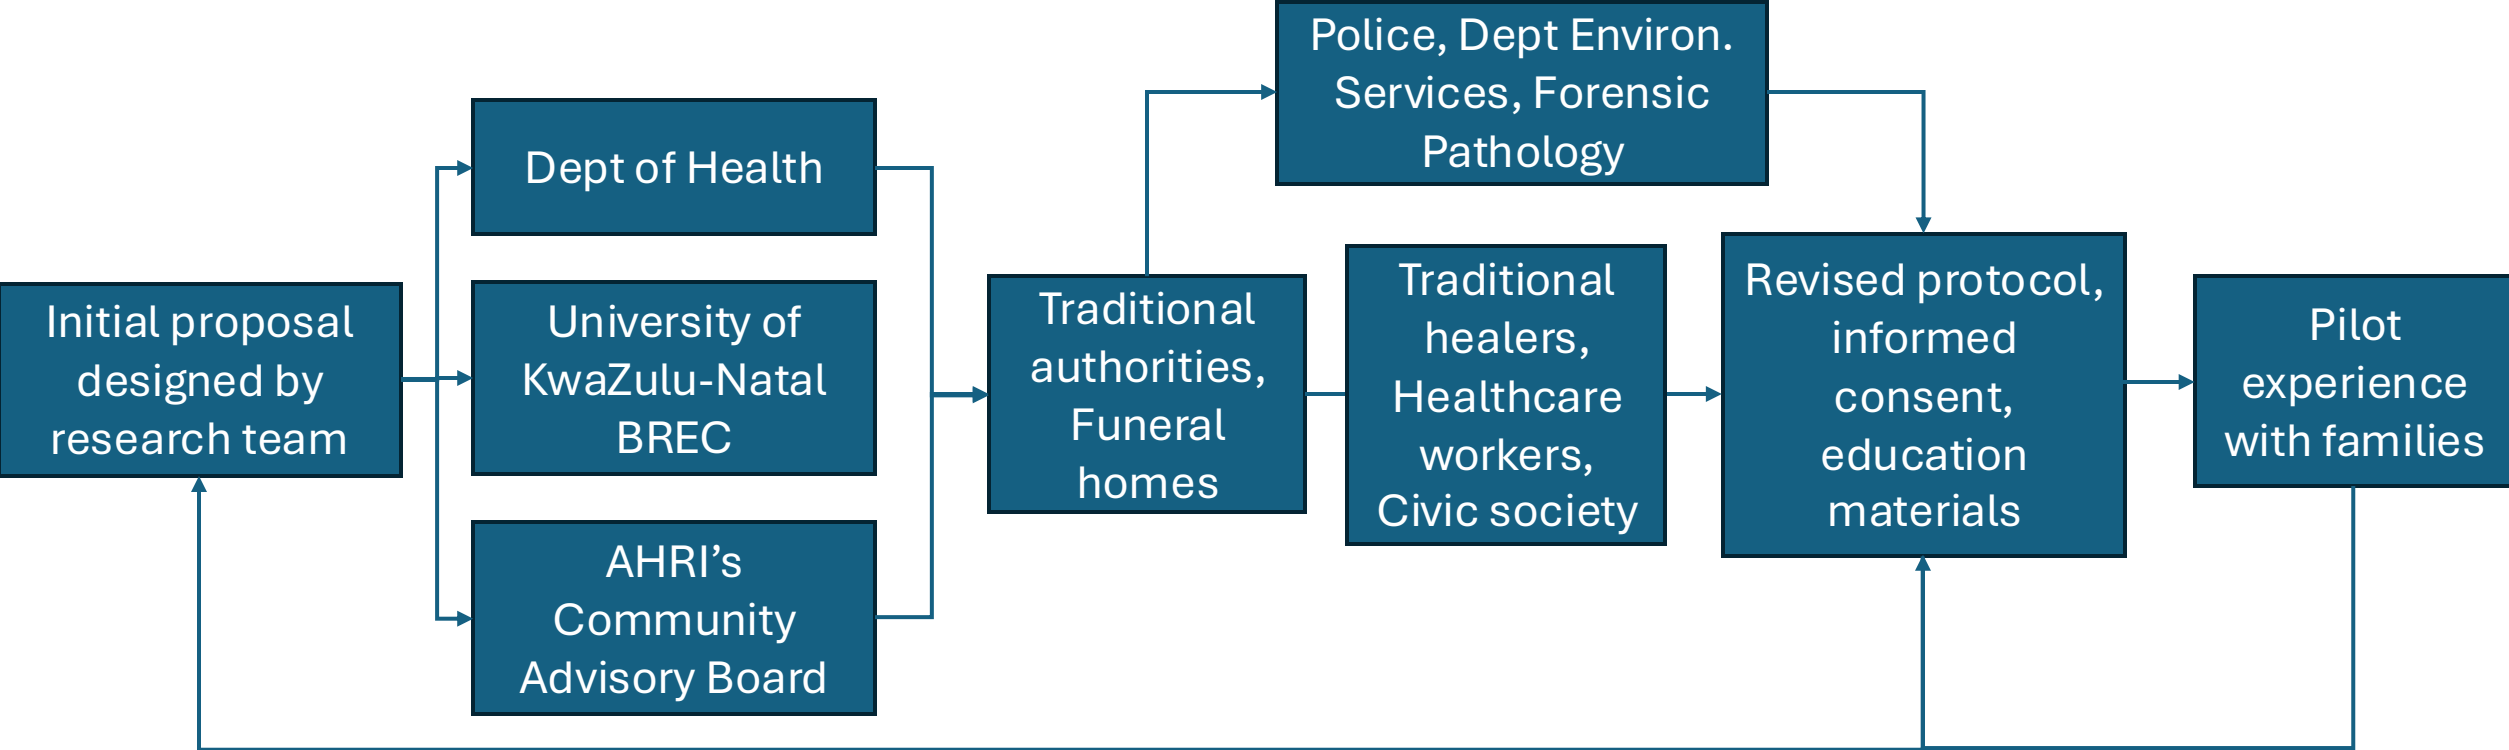

Table 1: Partner Engagement and Protocol Adaptations in Community-Based Pathologic Autopsy Program

Key Entity/Partner	Topic Areas Covered	Key Lessons Learned	Implications and Protocol Adaptation
Community Advisory Board (CAB)	Burial practices Beliefs about autopsy Cultural appropriate messaging	Burial within ~7 days of death Witchcraft beliefs Misconception is that forensic autopsies remove organs for traditional medicine, replaced with cotton	Ensured cultural sensitivity in outreach strategies, clarified medical objectives of autopsies, refined communication strategies to address misconceptions forthright
Department of Health	Distinguishing between forensic and natural death policies Trust of healthcare providers Medical-legal implications	Need to align with public health goals and regulations	Confirm only natural deaths were eligible, delineated protocols to not overlap with unnatural death referrals, clarified study scope to not implicate medical malpractice
Local Police Force	Referral pathways for unnatural deaths	Immediate notification to police if sudden death or suspect foul play	Established protocol for transferring cases to police if unnatural death is suspected
Local Traditional Authorities	Acceptance of program	Required endorsement for any study in the region	Gained approval to continue with autopsy study
Funeral Home Association	Engagement and partnership Use of facilities Facility compliance Referral strategies	Concerns about the role of funeral home staff communicating about autopsies, legal implications of conducting autopsies within facilities	Shifted to direct community outreach and community referrals instead of relying on funeral home staff to convey study, formalized collaboration through contracts, rented morgue space
Traditional Healers	Acceptance of program Traditional practices	Significance of traditional ritual ukushashazela	Adapted communication and consent processes to include provisions for traditional practices
Healthcare Providers' Partnership	Education of procedure benefits Referral of appropriate families	Involving healthcare providers is key for broadening reach	Referral pathways primarily through healthcare professionals
Civil Society Meeting	Acceptance of program	Required endorsement for any study in the region	Gained approval to continue with autopsy study

AUTOPSY RESEARCH PROGRAM

We often lose a loved one or family member without knowing the cause of death. The death certificate indicates natural causes. But what are these natural causes? As a family you may be left with questions that are difficult to answer. This is where Africa Health Research Institute's pathologic autopsy research program comes in.

PATHOLOGIC AUTOPSY RESEARCH PROGRAM

What is a pathologic autopsy?

A procedure done after a person dies to understand what led to the person dying.

Why would I have this done for my loved one?

- Closure and understanding about why your relative died
- The results may have health implications for you and your family members

Who does the procedure?

medRxiv preprint doi: <https://doi.org/10.1101/2024.11.14.24317019>; this version posted November 21, 2024. The copyright holder for this preprint (which was not certified by peer review) is the author/funder, who has granted medRxiv a license to display the preprint in perpetuity. It is made available under a [CC-BY 4.0 International license](#).

A specialist doctor, known as a pathologist.

What is the cost?

There is no cost.

What does the autopsy procedure entail?

- The body is examined externally and internally for evidence of what led to the **cause of death**
- Small samples from organs are taken for special testing - **not the whole organ**
- All organs are replaced and there is **no harvesting**, and no **substantial disfiguring** of the body
- Only individuals who have died of **natural** causes are eligible
- The autopsy results **cannot be used in a court of law**

When do we receive the results?

- 90 days (three months) after the procedure
- Our team member will contact the next of kin to deliver the confidential results

What is the goal of the autopsy research program?

- To better understand what people are dying of in this region
- This accurate information will help develop healthcare services to better respond to needs of the population
- Most importantly, it is your right to access autopsy services
