Supplementary methods

Variables, data sources, and bias

We obtained demographic and household characteristics and collected information on potential risk factors including occupation, exposure to SARS CoV-2 including travel history during the lockdown period, experience of symptoms and history of quarantine. These data were collected independent of serology using a standardized questionnaire at the initial survey.

Statistical tests and software

Analyses were performed using STATA v14.2 13.1, R Statistical Software v2.14.0 and GraphPad Prism v8.1.2. Spearman's non-parametric correlation analysis was done for dual datasets. Mann-Whitney test or Kruskal-Wallis ANOVA with Dunn's post-test was used to compare across groups. SPSS was used for regression analysis of sex and age data with serological tests and categorical comparisons made using the Chi-square test.

Box-and-whisker plots: the box extends from the 25th to 75th percentiles with the median indicated by a line. The whiskers mark the 5th and 95th percentiles.
