This table presents sample counts/frequencies from the overall PCR-CGP cohort broken down by nucleic acid concentration and specimen tumor surface area (TSA). Results presented here were restricted to analysis of samples with complete DNA/RNA concentration and specimen TSA info (n=29,793; 95.6% of total n=31,165). Sample counts and frequencies were calculated separately using DNA- and RNA-based nucleic acid concentrations, and both sets of summaries are presented here for comparison.

Clinically relevant biomarkers included here are those where, for patients with lung NSCLC adenocarcinoma, a positive test result is (a) associated with an FDA-approved and/or NCCN-recommended therapy (e.g., a therapy selection biomarker); or (b) thought to be mutually exclusive with known therapy selection biomarkers. Gene/biomarker labels associated with each indicated biomarker are listed in the first column, with pertinent PCR-CGP variant type(s) associated with each biomarker listed in the 'Variant Types' column. The 'Relevance' column indicates whether a given biomarker is associated with any FDA-approved therapy ('FDA'), NCCN therapy recommendation ('NCCN'), thought to be mutually exclusive with FDA-approved/NCCN-recommended therapy selection biomarkers ('Exclusive'), or a combination of these categories.

This table summarizes select patient characteristics for the 30,565 unique patients associated with 31,165 consecutive tissue specimens received for PCR-CGP testing. Any patients for which corresponding characteristic info was unavailable are categorized as 'N/A' for the indicated characteristic. Percentages displayed (%) reflect the frequency of patients assigned to each sub-group (e.g., attribute) within the corresponding patient characteristic. Submission of race information was not required during the study period.

Sample counts and PCR-CGP test reportability in 31,101 consecutively tested tissue specimens evaluable for meeting sample input requirements are shown. Overall samples counts (*n*) and frequencies (%) are stratified by sample requirement status (Pass/Exception) and indicated specimen attribute groupings. Sample requirement status indicates whether a given sample met all minimum PCR-CGP test requirements ('Pass': tumor surface area (TSA) >= 2mm², tumor content (TC) >= 20%, sample age <= 5 years, and DNA & RNA concentration >= 1ng/uL), or failed to meet at least one of these requirements ('Exception'). For 'Pass' samples, reportability results are stratified by tumor surface area (TSA); for 'Exception' samples, individual samples are grouped by the indicated attribute rules in the following order: (1) TC < 20%; (2) TSA < 2mm²; (3) sample age > 5 years; then, (4) DNA or RNA concentration < 1ng/uL. The overall cohort was then stratified by successfully reported tests or test failures. Tests were considered successfully reported if at least one prioritized alteration was reported OR the sample passed all sequencing quality control (QC) metrics and had TC >= 20%.

This table summarizes sequencing quality control (QC) performance across a subset of samples from the overall PCR-CGP sequencing cohort profiled between January 1, 2020 and June 25, 2020 (n=8,458). Sequencing QC performance is summarized by sample requirement status (Pass/Exception) and indicated specimen attribute groupings, with frequency of successfully reported samples presented separately for each requirement/attribute group. Here, sample requirement status indicates whether a given sample met all minimum PCR-CGP test requirements ('Pass'; minimum PCR-CGP test requirements include: tumor surface area (TSA) >= 2mm², tumor content (TC) >= 20%, sample age <= 5 years, and DNA & RNA concentration >= 1ng/uL), or failed to meet at least one of these requirements ('Exception'). For 'Pass' samples, sequencing QC (as well as reportability) results are broken down by TSA; for 'Exception' samples, individual samples are grouped by the indicated attribute rules in the following order: (1) TC < 20%; (2) TSA < 2mm²; (3) sample age > 5 years; then, (4) DNA or RNA concentration < 1ng/uL. For each indicated requirement/attribute combination, sample counts and relative contribution (%) to the sample set is presented in the first 2 columns of this table's 'Overall' section. Within the 'Overall' section, the 'Reported' column indicates the percentage of samples in the corresponding requirement/attribute bucket with a successfully reported test. Tests were considered successfully reported if at least one prioritized alteration was reported OR the sample passed all sequencing quality control (QC) metrics and had TC >= 20%. The 'Full QC Pass' column indicates the percentage of samples in the requirement/attribute bucket that passed all PCR-CGP variant class-specific sequencing QC assessment checks (includes QC checks specific to: point mutations or short insertions/deletions (Mutation); copy-number alterations (CNA); gene fusions (Fusion); microsatellite instability (MSI); and tumor mutation burden (TMB)). Within the 'CGP Variant Class' section of the table, variant class-specific sequencing QC 'pass' rates are presented across indicated requirement/attribute buckets. Each column in the 'CGP Variant Class' section reflects a separate variant class QC check routinely performed on each sample tested via PCR-CGP, with column headers reflecting the pertinent variant class (i.e., 'MSI') and number of samples passing that particular QC check across the full sample subset (i.e., '(n=8,118)'). *TC >= 20% is a QC metric for all variant classes and thus is equivalent to a QC fail for all variants (reflected in the 0% Full QC Pass rate); in the variant class QC pass metrics it was not applied to isolate the impact of TC on other QC metrics.

Prioritized biomarker frequencies in this PCR-CGP cohort are compared to those in the Memorial Sloan Kettering (MSK)-IMPACT pan-solid tumor, hybrid capture based CGP cohort of 10,917 clinical tumor samples. For each tumor type with ≥ 50 samples in each cohort, biomarker frequencies were determined per genes and variant class: MUT (mutations [SNVs and indels], HOMDEL (deep deletions), AMP (amplification), and FUSION (gene fusions). Per cohort, the number of samples per tumor type with the indicated variant (Variant n), the total number of samples in that tumor type (Sample n), the variant frequency in the cancer type (Cancer Type Freq), and the overall variant frequency (Overall Freq) are shown. To facilitate comparison, several PCR-CGP tumor types were combined in this analysis ('Biliary_Liver': Biliary and Liver, and 'Esophagus_Stomach': Esophagus and Stomach). Samples with multiple reported variants in a single gene + biomarker category were only counted once in corresponding frequency calculations. See **Methods** for additional details.

Prioritized biomarker frequencies in this PCR-CGP cohort are compared to those in the Memorial Sloan Kettering (MSK)-IMPACT pan-solid tumor, hybrid capture based CGP cohort. For each tumor type with ≥ 50 samples in each cohort, biomarker rates were determined per genes and variant class as shown in **Supplementary Table 7**. For each indicated tumor type, the total sample number per cohort, along with the Pearson correlation (*r*) of all included biomarker rates are shown. The overall sample number of included samples for both cohorts and the overall correlation of all biomarkers is also shown.

Supplementary Table 9. Informative PCR-CGP for Prostate Cancer

This table summarizes overall sample characteristics and informative test reports in 1,344 consecutive prostate cancer samples tested by the current StrataNGS PCR-CGP test version. Sample requirement status indicates whether a given sample met all minimum PCR-CGP test requirements ('Pass': tumor surface area (TSA) >= 2mm², tumor content (TC) >= 20%, sample age <= 5 years, and DNA & RNA concentration >= 1ng/uL), or failed to meet at least one of these requirements ('Exception'). Here, PCR-CGP results were only considered Informative if the sample had at least one positive actionable biomarker result (microsatellite instable high (MSI-H) or deleterious mutation/copy number deep deletion in *MSH2/6*, *BRCA1/2* or *ATM*, OR the sample passed all sequencing quality control QC metrics and had >=20% TC. 'Informative (Positive)' results indicate that the sample contained at least one positive actionable biomarker result.

This table summarizes overall sample characteristics and informative test reports in 1,144 consecutive non-small cell lung cancer (NSCLC) tissue specimens tested by the current StrataNGS PCR-CGP test version when NSCLC subtype (adenocarcinoma) was prospectively determined at the time of histopathologic review. Sample requirement status indicates whether a given sample met all minimum PCR-CGP test requirements ('Pass': tumor surface area (TSA) >= 2mm², tumor content (TC) >= 20%, sample age <= 5 years, and DNA & RNA concentration >= 1ng/uL), or failed to meet at least one of these requirements ('Exception'). Here, PCR-CGP results were only considered Informative if the sample had at least one positive therapy informative/actionable biomarker result (see **Supplementary Table 2**) OR the sample passed all sequencing quality control (QC) metrics and had >=20% TC. 'Informative (Positive)' results indicate that the sample contained at least one positive therapy informative/actionable biomarker result.
