

## **SUPPLEMENTARY METHODS**

### **CHEMBL Database**

ChEMBL curates approved drug information from the FDA Orange Book, WHO Anatomical Therapeutic Chemical classification and British National Formulary and clinical candidate information from ClinicalTrials.gov, United States Adopted Name applications and pharmaceutical company pipeline documents. The therapeutic targets of these compounds are manually annotated using a variety of sources including peer-reviewed literature and drug prescribing information, focusing on those proteins with which the drug directly interacts and that are believed to be responsible for the efficacy of the drug in the approved or clinically tested indications<sup>1</sup>. As well as individual proteins, targets in ChEMBL can represent protein complexes, protein families and other molecular groups that drugs may interact with and can therefore consist of multiple proteins. ChEMBL also includes extensive pharmacology data for drugs, candidates and preclinical/research compounds, extracted from Medicinal Chemistry literature. Such data can give supplementary information about additional proteins with which drugs may interact that could be responsible for adverse effects or have unknown biological relevance.

### **COVID-19 relevant drugs**

Nine publications and preprints were identified that contained cell-based screening data of drugs and clinical candidates against SARS-CoV-2.<sup>2-10</sup> Drug names were extracted from each publication and mapped to ChEMBL compound identifiers<sup>11</sup>, using a combination of automated mapping and manual curation, in order to align data from different publications. Drugs were considered active if they either had IC<sub>50</sub> or EC<sub>50</sub> measurements <10 $\mu$ M or had other measurements types and were defined as active by the authors.

Drugs and biologics being tested in interventional clinical trials for COVID-19 were identified from the ClinicalTrials.gov database (downloaded 07/20/20). Drug names were mapped to ChEMBL compound identifiers, where possible, and the phase of each trial captured. Blood products, cell-based therapies, vaccines and natural product mixtures were excluded.

Approved drugs with anti-inflammatory or immunomodulatory action were identified from ChEMBL (release 26) using ATC codes with the following prefixes: L03, L04, M01, A07E, H02, R06, R03BA and R01AD. Approved drugs with anti-coagulant action were also identified using ATC codes with the B01A prefix. COVID-relevant drugs were then mapped to the list of actionable genes via the curated therapeutic targets and potential target information in ChEMBL.

### **Biological relevance to SARS-CoV-2 infection**

We further annotated proteins that have biological evidence relating to their potential role in SARS-CoV-2 infection. This information included whether the abundance of the protein is regulated after SARS-CoV-2 infection<sup>12</sup>, whether the protein is believed to interact with viral proteins from SARS-CoV-2, SARS-CoV-1 or MERS-CoV<sup>13</sup>, whether the protein is implicated in other viral infections (<https://covid19.opentargets.org/>), the number of publications mentioning COVID-19 and the protein in the same sentence (<https://covid19.opentargets.org/>), information concerning human phosphoproteome changes during infection with SARS-CoV-2 (phosphosite dynamics as well as kinase activities)<sup>10</sup>, and finally, data regarding the effect of KO/KD of proteins during infection with SARS-CoV2 (CRISPR in Caco2 cells and iRNA in A549).<sup>13</sup>

### **Safety information**

Information about potential safety issues associated with proteins was extracted from the Open Targets platform.<sup>14</sup> This information includes known target safety risks identified from the literature and the HeCaTos projects, and experimentally identified safety risks from the eTox and TOX21 data sets. Safety issues relating to specific drugs were also collated from ChEMBL. This included whether any products containing the drug carry a boxed warning on their package label, whether the drug has been withdrawn for safety or efficacy reasons in at least one country, and finally whether the drug showed significant cytotoxicity in any of the cell-based SARS-CoV-2 screens described above (defined as a selectivity index  $\leq 2$ ).

## **Populations**

### *Million Veteran Program*

MVP is an ongoing, prospective biobank that recruits from 63 Veterans Health Administration (VA) medical facilities. Participants are linked to VA electronic health records (EHR), complete a questionnaire, and submit a blood sample at enrollment. Genotyping was performed using the MVP array, which is based on the UK Biobank Affymetrix Axiom array but with modifications tailored to the veteran population.<sup>15</sup> Samples were phased using EAGLE v2 software<sup>16</sup> and imputed with Minimac3<sup>17</sup> using the 1000 Genomes Project reference panel (phase 3, version 5).<sup>18</sup> Ancestry was determined through the HARE (harmonized ancestry and race/ethnicity) approach, which combines self-identified race/ethnicity and genetic information to more accurately determine ancestry groups.<sup>19</sup> The Veterans Affairs (VA) central institutional review board (IRB) and site-specific Research and Development (R&D) committees approved the Million Veteran Program study.
