This appendix provides further details of model parameterization, projections of attack rates and outcomes with vaccination, and additional results with a 20% vaccine coverage.

Table A1. Percentage of population in different age groups with and without comorbidities.

Condition	0-4	5-19	20-49	50-64	65+	All age groups
With comorbidity	5%	10%	28%	55%	78%	37%
Without comorbidity	95%	90%	72%	45%	22%	63%
Fraction of total population	5.9%	18.9%	39.6%	18.9%	16.6%	100%

The daily number of contacts for each agent was sampled from an age-specific negative-binomial distribution and contacts were distributed among different age groups based on a contact matrix (Table A2).

Table A2. Mixing patterns and the daily number of contacts derived from empirical observations. Daily numbers of contacts were sampled from negative binomial distributions for different scenarios.

Age group	Proportion of contacts between age groups					Number of daily contacts without self-isolation Mean (SD)	Number of daily contacts for self-isolated individuals Mean (SD)
	0-4	5-19	20-49	50-65	65+		
0-4	0.2287	0.1839	0.4219	0.1116	0.0539	10.21 (7.65)	2.86 (2.14)

Results for vaccination scenarios with 20% vaccine coverage

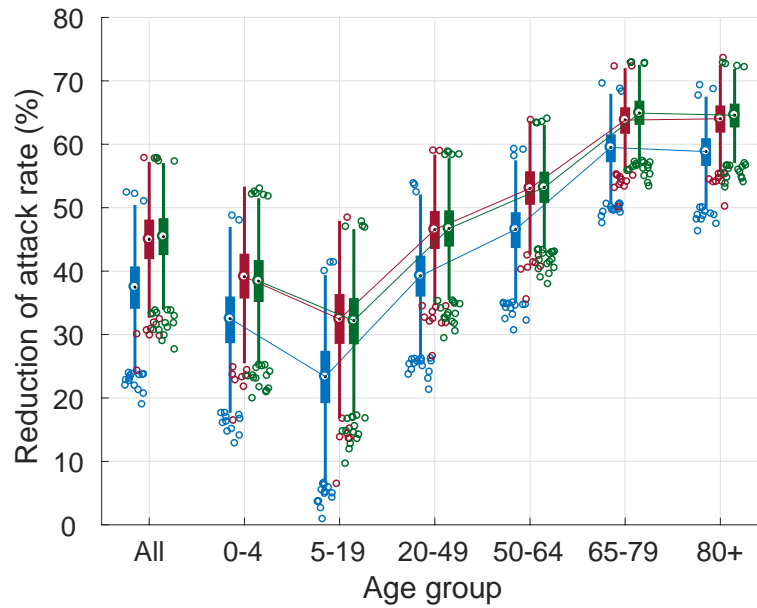

Figure A1. Overall and age-specific relative reduction of mean attack rates with vaccination, as compared to the outbreak scenario in the absence of vaccination, with 5% (blue), 10% (red), and 20% (green) levels of pre-existing immunity.

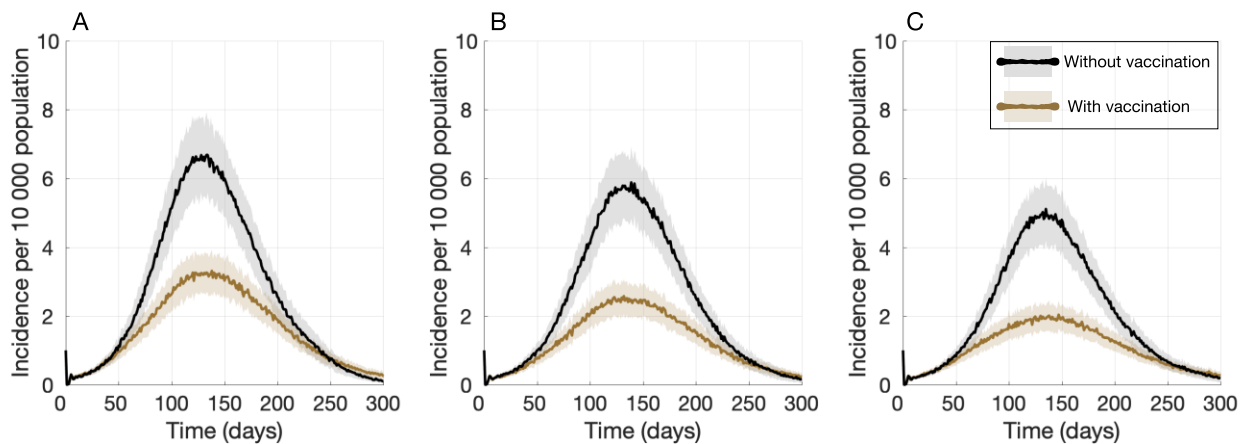

Figure A2. Projected daily incidence of COVID-19 per 10,000 population with 5% (A), 10% (B), and 20% (C) levels of pre-existing immunity.

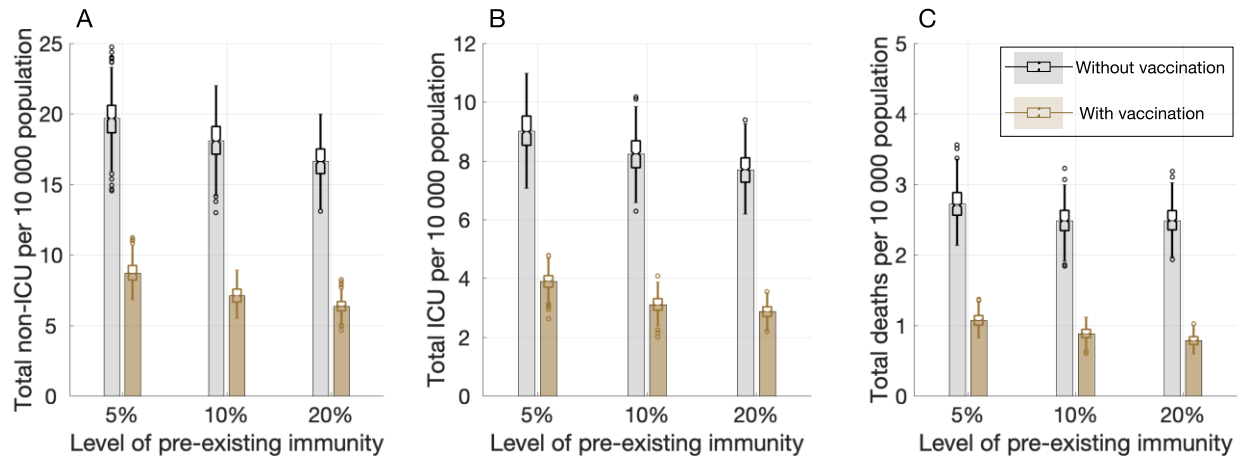

Figure A3. Projected daily number of non-ICU hospitalizations (A), ICU hospitalizations (B), and deaths (C) with 5%, 10%, and 20% levels of pre-existing immunity.
