

**Supplementary Figures:**

**Supplementary Figure 1. Post mortem histological analysis of focal invasive pulmonary aspergillosis (IPA).**

A. Focus of invasive aspergillosis in the left lower lobe involving a large vessel with surrounding lung showing diffuse alveolar damage (approximately 1cm x 1cm) (Haematoxylin & Eosin x 12). B. This was a single focus identified from ten 3 x 2cm sections of lung. B. Focal invasive aspergillosis was identified microscopically at post-mortem (Grocott silver stain x 100).

**Tables:**

**Supplementary Table 1.** Proportion of patients with different *Klebsiella* spp. in respiratory and blood cultures and their acquired resistance phenotypes impacting on guideline recommendations.

**Supplementary Table 2A.** Sequencing metadata for all respiratory samples processed with clinical metagenomics.

**Supplementary Table 2B.** Negative controls run with each batch of samples sequenced.

**Supplementary Table 3.** Phenotypic resistance reported by culture and resistance genes reported by clinical metagenomics in all culture-positive samples after 2 hours of sequencing.

**Supplementary Table 4.** Microbiology, PCR and clinical metagenomics results for all samples processed in this study for the identification of *Aspergillus fumigatus*.

**Supplementary Table 5.** *Klebsiella pneumoniae* and *Corynebacterium striatum* alignment for outbreak analysis. (A) Number of SNPs between each sample of *Corynebacterium striatum*. (B) Number of SNPs between each sample of *K. pneumoniae*, (C) the 7 predicted gene multi-locus sequence types for each sample against the *K. pneumoniae* database (numbers in each gene column refer to the allele - a ~ indicates a full length allele similar to the given allele but less than 100% identity) and (D) number of SNPs analysis in between the two identical CMg samples and two epidemiologically linked *K. pneumoniae* isolates.

**Supplementary Table 6.** All organisms identified in all respiratory samples processed with clinical metagenomics (above pre-defined thresholds<sup>a</sup>).

**Supplementary Table 1.** Proportion of patients with different *Klebsiella spp.* in respiratory and blood cultures and their acquired resistance phenotypes impacting on guideline recommendations

| <i>Klebsiella spp.</i> identified         | Number in respiratory tract (%) | Acquired $\beta$ -lactam Resistance | Acquired resistance phenotypes (number) | Number in blood (% <sup>f</sup> ) |
|---|---------------------------------|-------------------------------------|---|-----------------------------------|
| <i>K. pneumoniae</i>                      | 51 <sup>a</sup>                 | 32 (63%)                            | ESBL + AGR (13)                         | 3 (23%)                           |
|   |                                 |                                     | Other: non-ESBL + AGS <sup>d</sup> (16) | 6 (30%)                           |
|   |                                 |                                     | Other: AGS <sup>e</sup> (4)             | 0                                 |
|   |                                 |                                     | None (28)                               | 3 (11%)                           |
| <i>K. aerogenes</i>                       | 37 <sup>a</sup>                 | 0 <sup>c</sup>                      | N/A                                     | 5 (14%)                           |
| Other <i>Klebsiella spp.</i> <sup>b</sup> | 6                               | 1                                   | N/A                                     | 2 <sup>g</sup> (33%)              |

<sup>a</sup> Includes 6 patients with *K. pneumoniae* and *K. aerogenes* in respiratory specimens at different times. Where total numbers in different columns or rows differ this is due to co-infection with different *Klebsiella spp.* or their resistance phenotypes at some time during ICU stay.

<sup>b</sup> 5 *K. oxytoca* and 1 *K. variicola*

<sup>c</sup> *K. aerogenes* intrinsic resistance to co-amoxiclav and piperacillin-tazobactam

<sup>d</sup> 14 resistant to co-amoxiclav and piperacillin-tazobactam and 6 others

<sup>e</sup> Co-amoxiclav susceptible but with resistance to second or third generation cephalosporins)

<sup>f</sup> % = Number of patients with *Klebsiella* BSI/number with *Klebsiella* in respiratory tract.

<sup>g</sup> 1 *K. oxytoca* with no acquired resistance and 1 *K. variicola* with resistance to co-amoxiclav and piperacillin-tazobactam

AGR = aminoglycoside resistance. AGS =aminoglycoside susceptible

**Supplementary Table 2A.** Sequencing metadata for all respiratory samples processed with clinical metagenomics.

**Supplementary Table 5.** *Klebsiella pneumoniae* and *Corynebacterium striatum* alignment for outbreak analysis. (A) Number of SNPs between each sample of *Corynebacterium striatum*. (B) Number of SNPs between each sample of *K. pneumoniae*, (C) the 7 predicted gene multi-locus sequence types for each sample against the *K. pneumoniae* database (numbers in each gene column refer to the allele - a ~ indicates a full length allele similar to the given allele but less than 100% identity) and (D) number of SNPs analysis in between the two identical CMg samples and two epidemiologically linked *K. pneumoniae* isolates.
