<b>Other lung disease</b>	NA	NA	10.9%	16.2%	10.0%
<b>Cancer</b>	NA	NA	4.4%	5.4%	1.7%
<b>Haematological cancer</b>	NA	NA	2.2%	5.4%	0.0%
<b>Corticosteroids</b>	NA	NA	19.6%	10.8%	10.0%
<b>Immunosuppressive treatment</b>	NA	NA	17.4%	16.2%	5.0%

SD is standard deviation, and IQR is interquartile range.

*COVID-19 chest radiology*: chest X-ray/ CT scan showed changes compatible with COVID-19, as opposed to normal findings or lung changes diagnostic of other conditions.

*Non-COVID19 admissions*: cases where COVID-19 was diagnosed during the hospital stay in patients initially admitted to hospital for reasons unrelated to COVID-19

*Haemoglobin, serum albumin and serum creatinine*: results from routine lab tests on the day of study enrollment, or closest result up to 2 days before. The included test results are available for at least for 75% of each severity group.

*LOS*: length of hospital stay (days from hospital admission to discharge, transfer or death in hospital)

*Hypertension*: history of hypertension, defined as blood pressure  $\geq 140/80$  on multiple occasions, or on treatment with any medication explicitly employed to reduce blood pressure

*CAD*: history of coronary artery disease, defined as myocardial infarction, angina, coronary artery stenting or coronary artery bypass grafting

*Other heart condition*: history of any other chronic cardiac disease (not CAD/hypertension), e.g. heart failure, congenital heart disease, cardiomyopathy, rheumatic heart disease

*CKD*: history of chronic kidney disease, defined as any of estimated glomerular filtration rate  $< 60$  mL/min/1.73m<sup>2</sup>, dialysis or kidney transplant

*PVD*: history of peripheral vascular disease, defined as intermittent claudication or past bypass for chronic arterial insufficiency, history of gangrene or acute arterial insufficiency, or thoracic/abdominal aneurysm ( $\geq 6$  cm)

*CVA/TIA*: history of a cerebrovascular accident or transient ischemic attacks

*COPD*: history of chronic obstructive pulmonary disease

*Other lung disease*: history of other chronic pulmonary disease (non asthma/COPD), e.g. cystic fibrosis, bronchiectasis, interstitial lung disease

*Cancer*: current solid organ malignancy (active or in the last 5 years), except non-melanoma skin cancers

*Corticosteroids*: history of treatment with systemic corticosteroids in the 14 days prior to hospital admission/presentation

*Immunosuppressive treatment*: history of treatment with immunosuppressants (excluding corticosteroids) in the 14 days prior to hospital admission/presentation, or chemotherapy/biologic drugs in the previous 6 months

Table S2: patients excluded because of extreme confounding comorbidities

Study ID	Patient profile
CV0266	Metastatic lung adenocarcinoma on immunotherapy and chemotherapy, presentation with new onset heart failure and pulmonary oedema, borderline positive COVID-19 PCR on nasopharyngeal swab, but no other clinical features of COVID-19
CV0258	Prolonged hospital admission for new diagnosis of acute myeloid leukemia with suspected leukemic lung infiltration and fungal chest infection, commenced on chemotherapy. COVID-19 PCR negative at hospital admission and subsequently positive.
CV0143	Mild COVID-19 symptoms, admitted for extensive necrotizing fasciitis/mediastinitis, treated with surgical debridement and complicated by massive haemorrhage. Enrolled in the study in the ITU after surgery.
CV0192	Emergency splenectomy following trauma. Fever and pneumonia in the post-op, with radiology in keeping with aspiration. Borderline positive COVID-19 PCR on nasopharyngeal swab.
CV0033	Lymphoma on palliative chemotherapy, initially admitted for interstitial pneumonia and neutropenia and treated as Pneumocystis pneumonia. COVID-19 PCR initially negative 4x and subsequently positive after 2 weeks.
CV0313	End-stage alcoholic cirrhosis with variceal bleeding and hepatic encephalopathy, admitted for transjugular intrahepatic portosystemic shunt procedure. Positive COVID-19 PCR on nasopharyngeal swab, initially with normal chest X-ray. Subsequently developed severe chest infection with bronchoalveolar lavage positive for Gram negative organisms and negative for COVID-19 PCR.

Table S3: WGCNA module gene list and heme GSEA intersect genes (shared between C/D/E in the leading edge)

Csv file

Table S4: **Antibody staining panel used for flow cytometry (FACS) analysis.** Aliquots of PBMCs were stained with one of two antibody combinations prior to FACS analysis. The laser and band pass filter combination used to detect each antibody is also shown.

## Supplementary Figure Legends

**Figure S1: Swimmer plots for study patients in groups C, D and E.** Arrows indicate days since start of COVID-19 symptoms (or since positive SARS-CoV-2 PCR test, if asymptomatic). Black boxes indicate the duration of hospital stay whilst enrolled in the study. If patients were transferred from other hospitals (as indicated by the triangle symbol), information relative to the time before transfer to one of the study hospitals may be missing. Research blood collection timepoints are indicated by open circle, and time of death by red cross for deceased patients. Degree of respiratory support is indicated by colour gradient as per the key provided. **A)** Information illustrated for patients in groups C, **B)** patients in group D, and **C)** patients in group E. **D)** SARS-CoV-2 PCR CT values over time across patient severity groups. CT values  $\leq 38$  were reported as a positive result. A discretionary CT number of 45 was assigned to samples with no detectable SARS-CoV-2 RNA. Each colour correspond to a different subject. Repeat measures for a single participant are linked by dashed line. Y axis is inverted.

**Figure S2: Comparison of absolute cell counts derived by flow and mass cytometry.** Scatter plots showing the correlation between cell population quantified by both flow and mass cytometry (cells/uL). Pearson correlation R value and p-values of correlation test are reported for each comparison.

**Figure S3: Cellular changes over time in COVID-19 patients - extended figure 2 including the full cell dataset.** **A)** Heatmap showing the log<sub>2</sub> fold change in median absolute cell count between COVID-19 patients and healthy controls, within severity categories and across 12-day time bins. Missing data are shown in grey. Wilcoxon test FDR adjusted p-values: \* $<0.05$ , \*\* $<0.005$ , \*\*\*  $<0.0005$ . **B)** Boxplots showing absolute counts (cells/uL) for all the cell populations, split by severity categories and 12-day time bins post screening (group A) or symptom onset (group B-E). Points are coloured based on asymptomatic or symptomatic classification for categories A and B respectively, normal or abnormal chest radiology (group C), and type of respiratory support at time of sampling (groups D and E), as per the key colour provided. **C)** Mixed-effects model with quadratic time trend showing the longitudinal trajectories of all the cell populations over time, grouped by severity. Nominal and adjusted p-values for the time x severity group interaction term are reported.

In **B)** and **C)** Grey band indicates interquartile range of the corresponding population in healthy controls. NIV/HF, non-invasive ventilation/high-flow oxygen; ECMO, extracorporeal membrane oxygenation. Hb, haemoglobin.

**Figure S4: Whole blood transcriptomic signatures over time – extended figure 3.** **A)** Annotation of Latent Factors used to perform the cell subset deconvolution shown in Fig.3A. **B)** and **C)** data derived from WGCNA. **B)** Dendrogram and heatmap showing the correlation between gene expression eigenmodules. **C)** Heatmap illustrating the correlation among whole blood co-expression gene modules (coloured blocks, y axis) and age, gender, steroid treatment, CRP levels, and the comparison between healthy controls and COVID-19 cases split by severity in 24 days bins (x axis). Pearson correlation and FDR corrected p-values are shown for each comparison. **D)** Annotation of modules that correlate with disease and/or severity. **E)** Correlation between SARS-CoV-2 PCR CT values and Interferon Signature Genes (IGS) module eigenvalues.

**Figure S5: Multivariate analysis of immune-cell populations in early disease - extended figure 4.** **A)** Mixed-effect model with quadratic time trend showing the longitudinal trajectories of inflammatory characteristics, and boxplot at time of sampling ( $\leq 10$  days post symptom onset), for individual in clusters 1 and 2. **B)** Mixed-effect model with quadratic time trend showing the longitudinal trajectories for all cell populations over time, for COVID-19 cases in clusters 1 and 2. Grey band indicates the interquartile range of the corresponding population in HCs. Nominal and adjusted p-values for the time x cluster interaction term are reported. Variable selection by sPLS-DA. **C)** PLS-DA showing discrimination of patient clusters 1 and 2 derived in Fig. 4B. **D)** Associated classification error rate of the predictive model across 10 iterations of 5-fold cross validation for components 1-10. **E)** Feature selection on components 1 and 2, determining 13 cell subsets as key contributors to cluster discrimination with minimal error. Unsupervised clustering of 13 selected cell types (normalised to the median of healthy controls), with original sample clusters and patient characteristics indicated.

**Figure S6: SARS-CoV-2 specific T cell response – extended figure 5E.** Spot forming unit (SFU) numbers of CD3 T cells secreting IFN $\gamma$  in response to membrane, nucleocapsid and spike SARS-CoV-2 antigen stimulation, in patient samples from groups B, and D and E combined, one or two weeks post symptom onset.

**Figure S7: Correlation plots – extended figure 7C.** Heatmap showing the correlation between gene expression eigenmodules derived from whole blood RNASeq, absolute cell counts and inflammatory characteristics in COVID-19 patients collected within **A)** the first 24 days, or **B)** between 25-48 days post screening or symptom onset. Pearson correlation p-values: \*p<0.05, \*\*p<0.01 and \*\*\*p<0.001.

**Figure S8: Flow cytometry gating strategy.** **A)** B cell, **B)** non-conventional T cell, **C)** DCs and monocyte, **D)** T regulatory cells, and **E)** conventional T cell panels.

## Figure S1

### Swimmer plots for study patients (groups C/D/E)

#### Legend

	no supplemental oxygen
	supplemental oxygen
	NIV/HF
	invasive ventilation
	ECMO
	research bloods
	asymptomatic
	admitted to other hospital
	transferred to other hospital
	deceased

Arrows indicate days since start of COVID-19 symptoms (or since positive SARS-CoV-2 PCR test, if asymptomatic).

The black boxes highlight the time when study volunteers were admitted to the hospital where they were enrolled in the study.

If patients were transferred from other hospitals (as indicated by the triangle symbol), information relative to the time before transfer to one of the study hospitals may be missing.
