### Cost vs Performance of Multiple Optimization Methods on Trauma Data

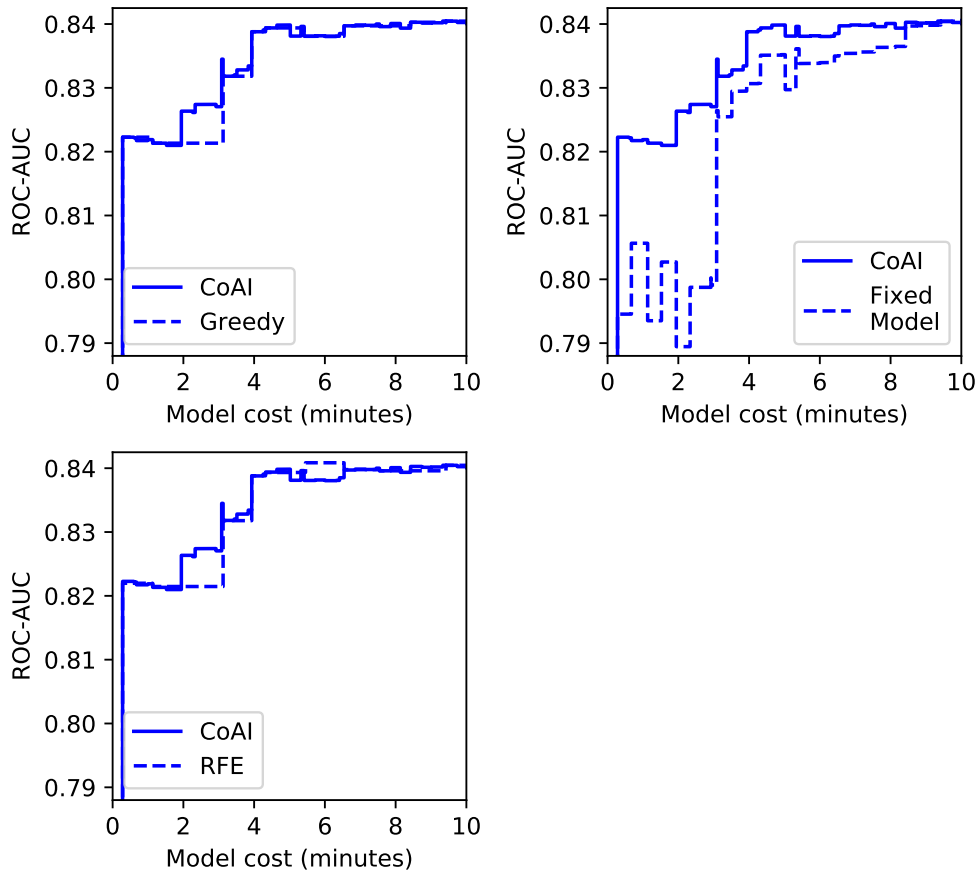

Figure 3: Performance of CoAI variants on the trauma data, including a greedy solution to the knapsack problem where features are added in order of decreasing (importance divided by cost), a method using the same knapsack solver as the maintext but without model retraining, and a recursive feature elimination based method where the feature with lowest (importance divided by cost) is removed from the model, the model is retrained, and the process is repeated until the budget  $k$  is satisfied.

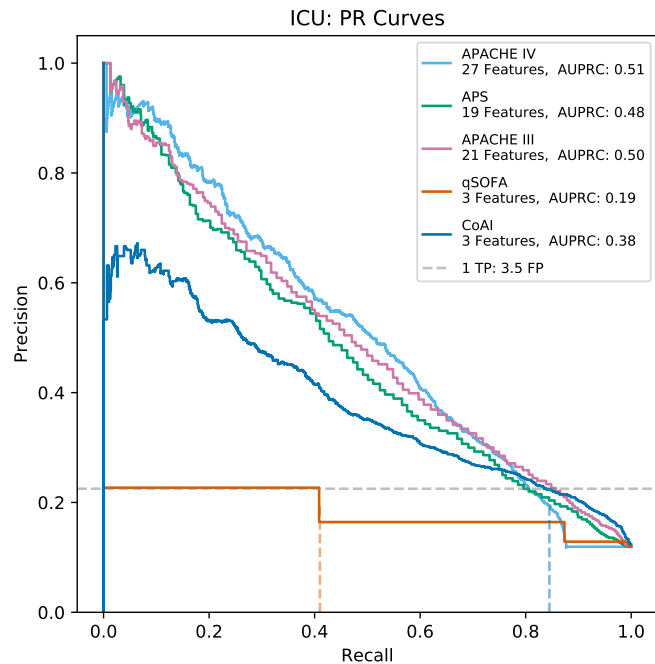

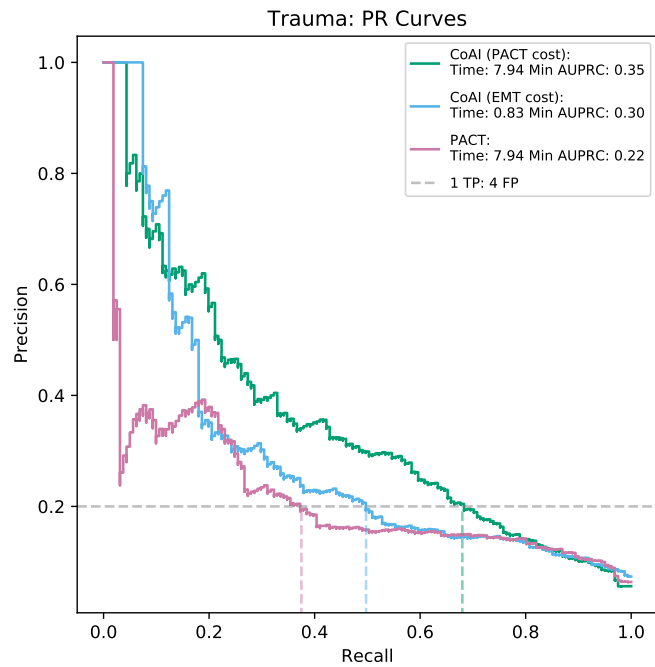

Figure 4: Precision-recall plots for the trauma (top) and ICU (bottom) datasets. Performance curves are shown for CoAI and for the clinical models it was compared against. Horizontal gray lines indicate selected operating points; in the trauma dataset, we chose an operating point with 4 false-positives for every true positive. In the ICU dataset, qSOFA had a limited number of operating points so we compared at a 3.5:1 operating point. Vertical colored lines match model performance at given operating points to the x-axis for easier comparison of recall.

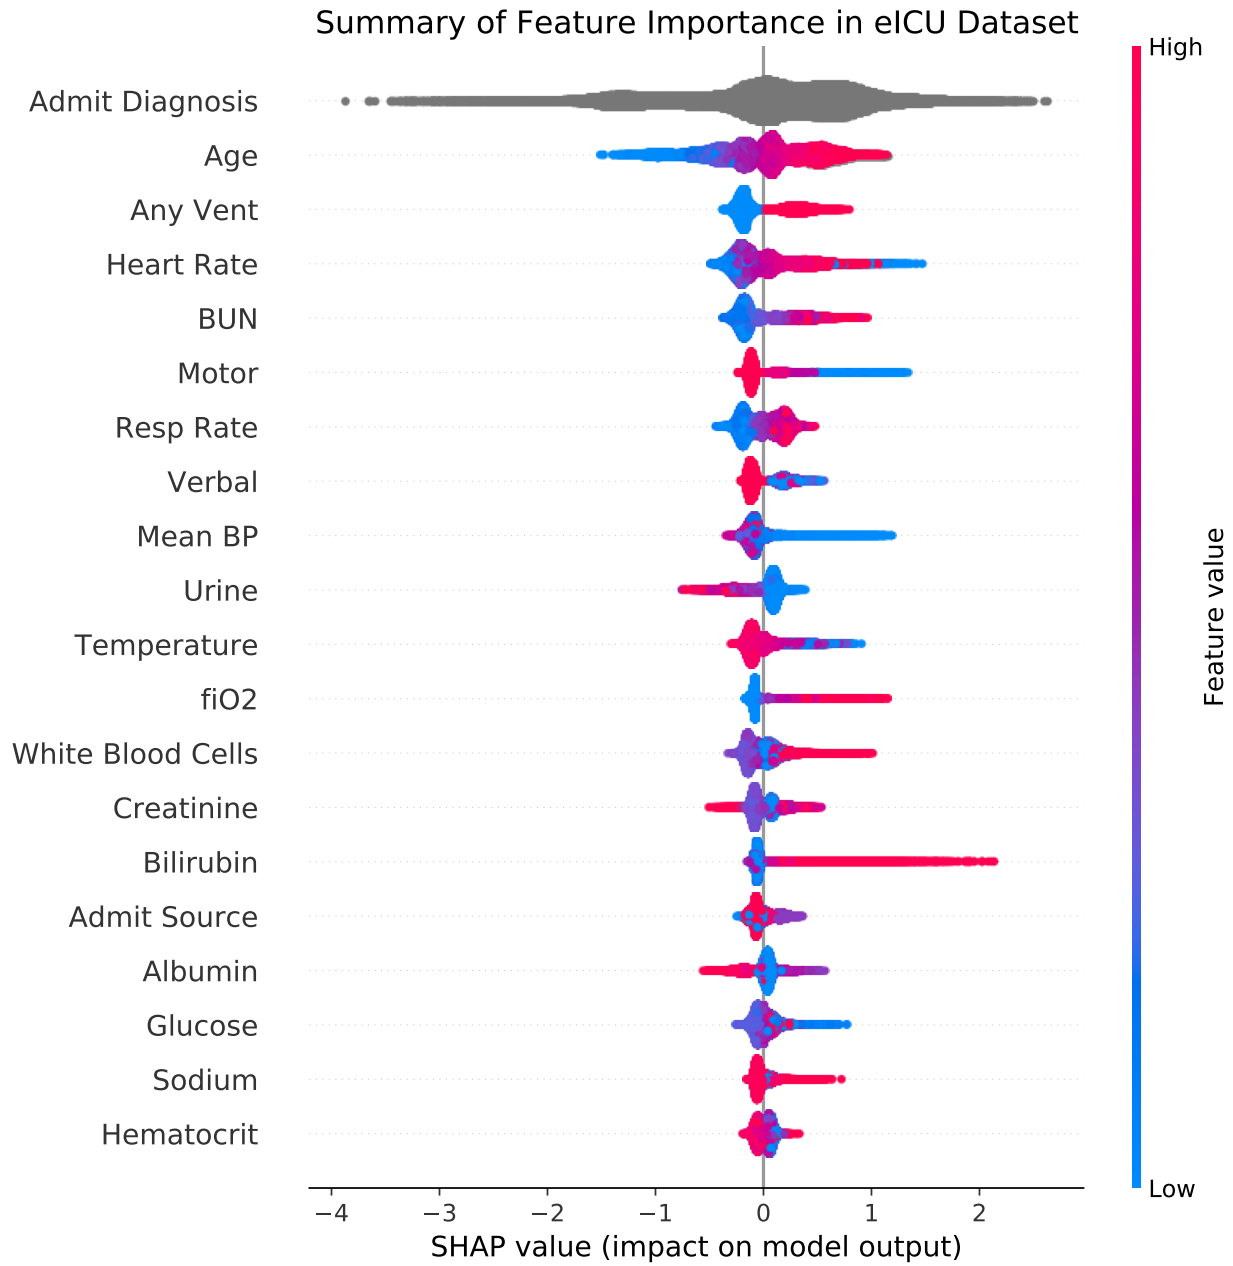

Figure 5: Summary of feature importance for predicting mortality in the eICU dataset.

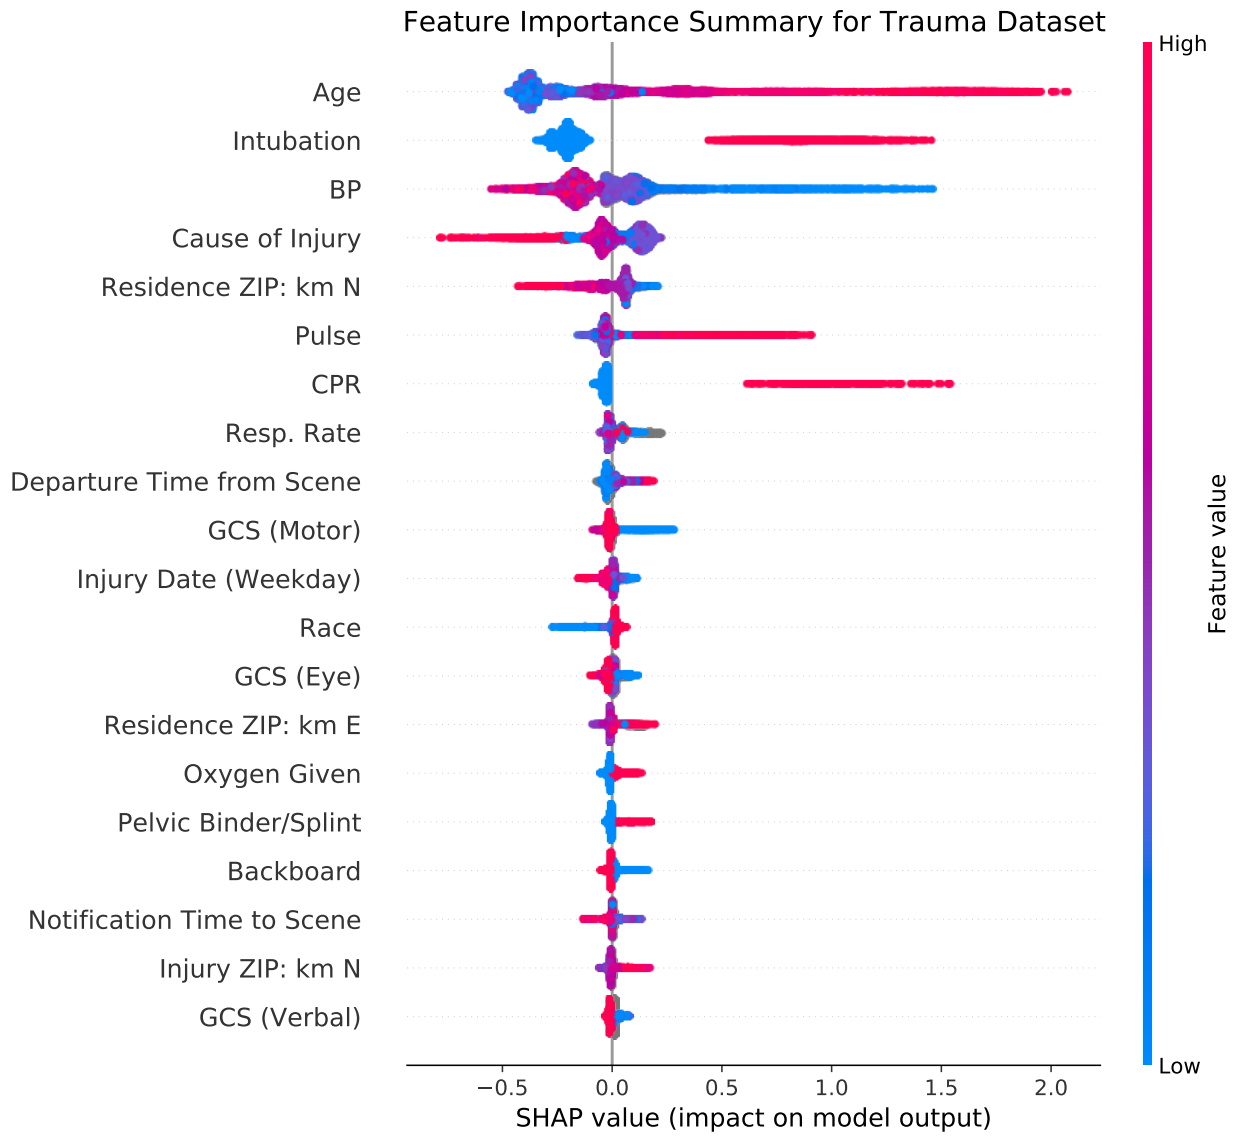

Figure 6: Summary of feature importance for predicting mortality in the trauma dataset.

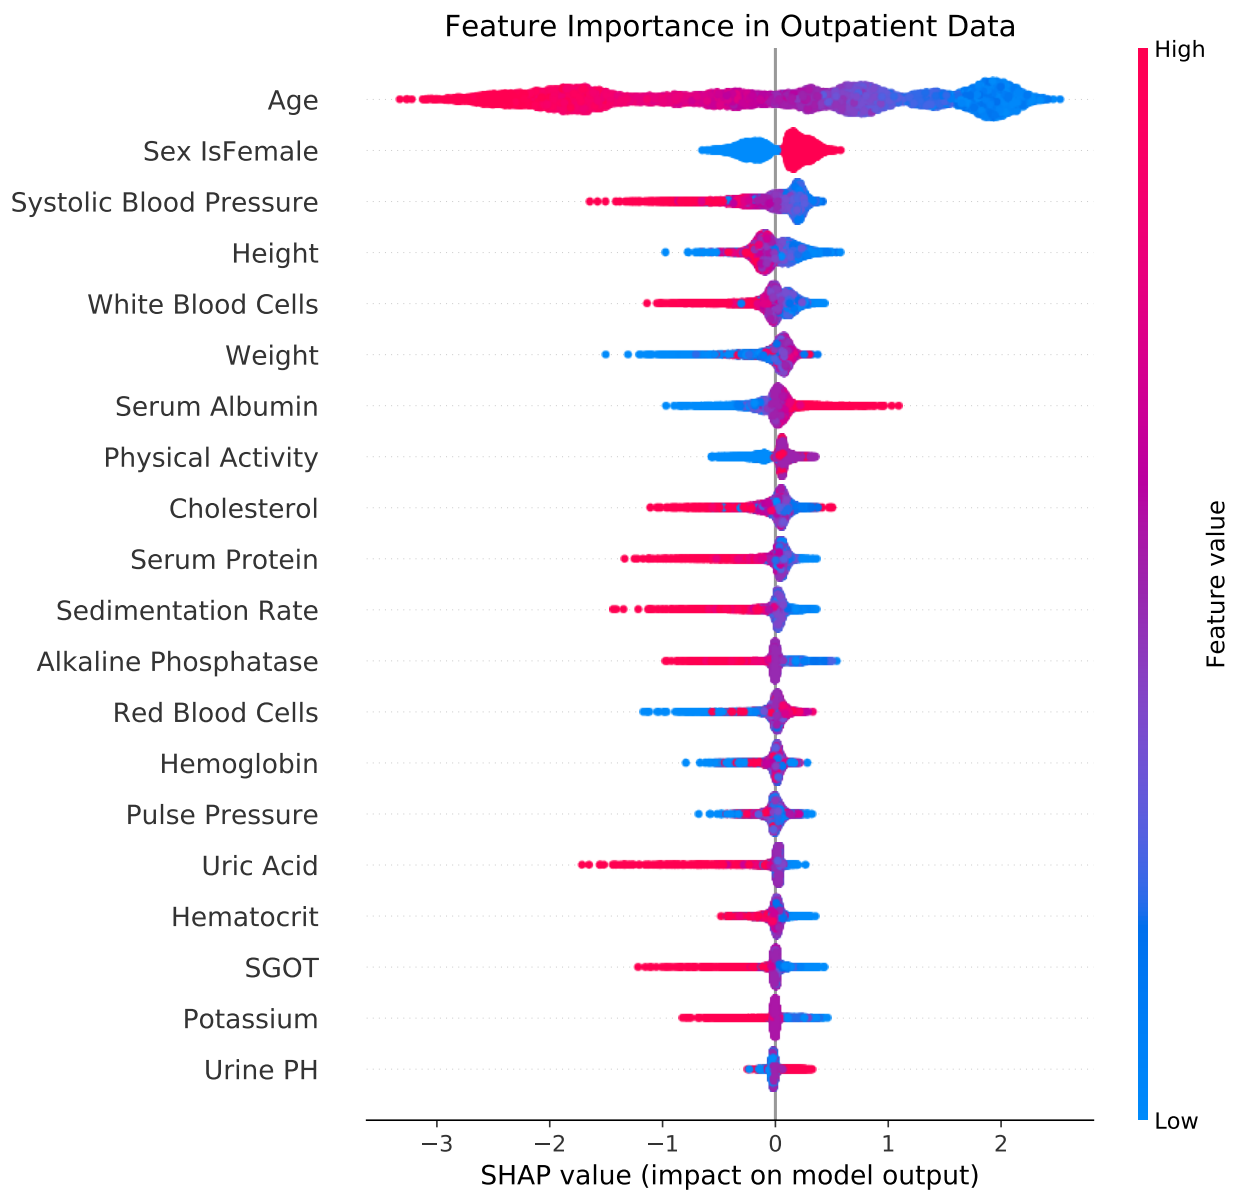

Figure 7: Summary of feature importance for predicting mortality in the outpatient dataset.

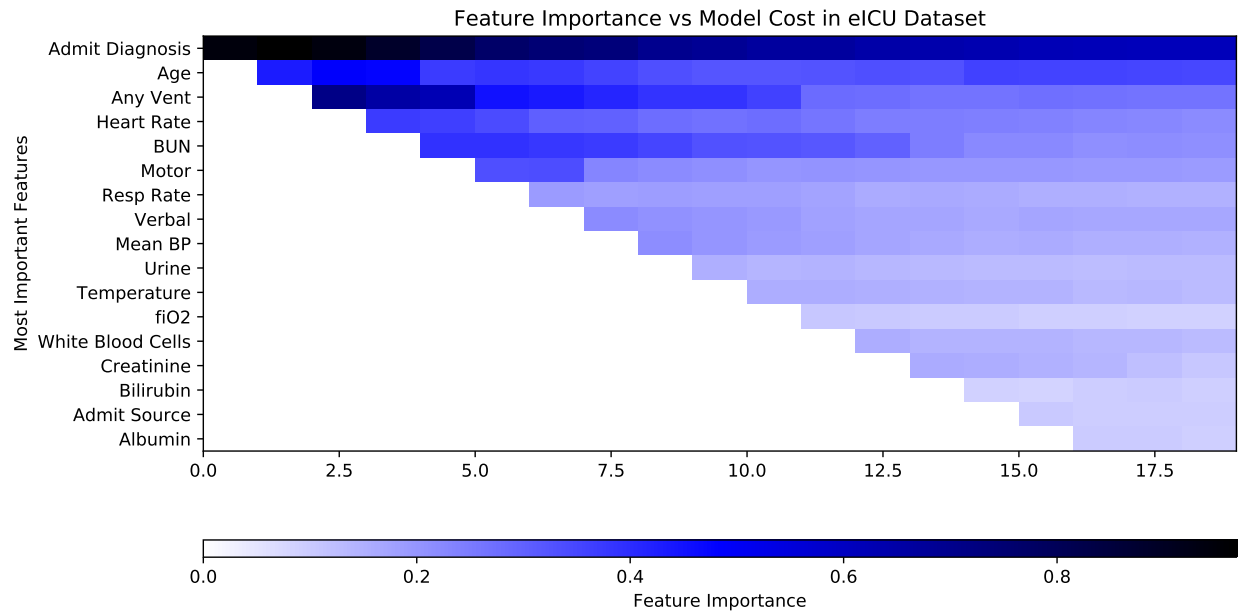

Figure 8: Feature importance heatmap for CoAI on eICU dataset.

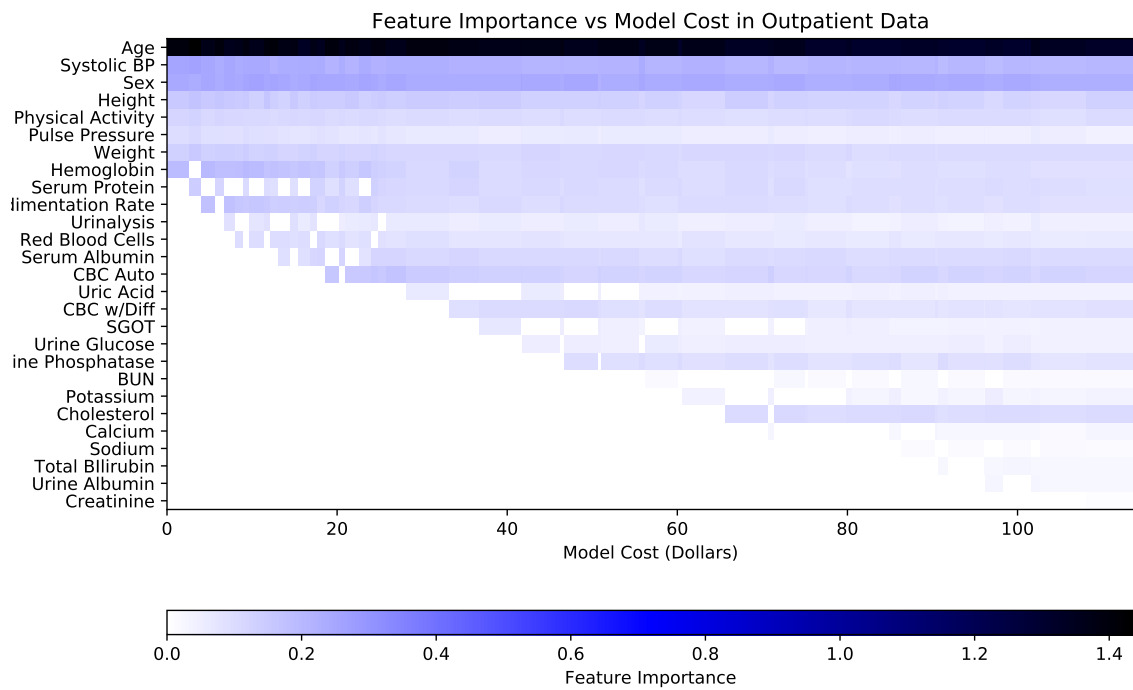

Figure 9: Feature importance heatmap for CoAI on outpatient dataset.

Method 1	Method 2	T-statistic	p-value
CoAI (GBM)	CoAI (Linear)	27.241980	8.569957e-48
CoAI (GBM)	CEGB	9.970269	1.270177e-16
CoAI (GBM)	CWCF	18.076428	4.522429e-12
CoAI (Linear)	CEGB	-26.157262	2.943945e-46
CoAI (Linear)	CWCF	14.619751	1.122264e-10

Figure 10: Statistical significance of performance differences between all methods on trauma dataset.

Method 1	Method 2	T-statistic	p-value
CoAI (GBM)	CoAI (Linear)	-6.259210	9.970512e-09
CoAI (GBM)	CEGB	5.757907	9.590193e-08
CoAI (GBM)	CWCF	6.094629	2.701177e-06

## 2 EMS Provider Survey

Preliminary

EMS Trauma Scene Response Survey

**Thank you for participating in this survey! In this form, we will ask you for your best estimate of the time or effort required to obtain various types of pre-hospital data about patients that may be useful for diagnosis or risk stratification. The results of this survey will help us build easier-to-use computerized diagnosis and risk-scoring tools.**

Figure 12: Survey form for trauma

Which of the following EMS certifications do you hold?

- EMT-B
- AEMT
- Paramedic
- Flight paramedic
- Flight nurse
- MD

Which EMS agency do you currently work for?

- |  |   |
|--|---|
| <input type="checkbox"/> Airlift Northwest                   | <input type="checkbox"/> Bellevue Medic One |
| <input type="checkbox"/> Other ambulance company             | <input type="checkbox"/> Redmond Medic One  |
| <input type="checkbox"/> Other EMS, not an ambulance company | <input type="checkbox"/> Falck              |
| <input type="checkbox"/> Seattle Fire Medic One              | <input type="checkbox"/> TriMed             |
| <input type="checkbox"/> King County Medic One               | <input type="checkbox"/> AMR                |
| <input type="checkbox"/> Shoreline Medic One                 |   |

For how many years have you worked in any EMS role?

Figure 13: Survey form for trauma

## Dispatch Variables

**(Required)** How much **TIME** does it take to gather the following patient information during a trauma response?

In each case, we are asking for your best estimate, in seconds or minutes, of the total time required to gather the necessary information.

*For reference, information that is provided and known at the time of dispatch should be thought of as requiring zero time.*

PLEASE MOVE THE SLIDER TO RECORD THE TIME REQUIRED FOR EACH ITEM

Figure 14: Survey form for trauma

**(Required) HOW DIFFICULT or burdensome** it is to gather the following patient information during a trauma response?

We are asking for your best estimate, as a subjective rating of the amount of effort required, with 1 being the least and 10 being the most, to gather the necessary information.

*For reference, a rating of 1 might be assigned to information that you have been provided at the time of dispatch and requires almost no effort. A rating of 10 might represent information that is very difficult to obtain, due to the need for detailed patient interview or close physical examination or an advanced procedural task.*

PLEASE MOVE THE SLIDER TO RECORD THE LEVEL OF DIFFICULTY FOR EACH ITEM

Figure 22: Survey form for trauma

### Usage Questions

Do you currently use computerized risk scores during EMS trauma responses?

- Yes
- No

Which computerized risk scores do you use during an EMS response?

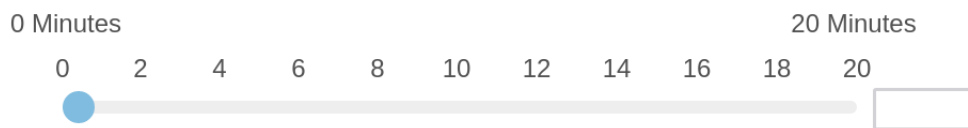

Figure 23: Survey form for trauma

What do you like about the risk scores you currently use?

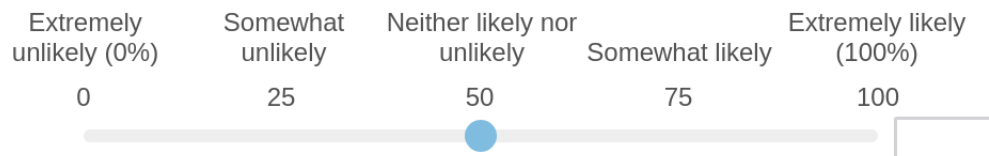

What don't you like about the risk scores you currently use?

Figure 24: Survey form for trauma

How much time (in minutes) during an average trauma response do you spend using computerized risk scores?

How likely would you be to add a new computerized risk score to your workflow during a trauma response?

**(Required)** In your opinion, **what is an appropriate amount of time** (in minutes) during an EMS trauma response to spend using a computerized score that provides risk estimates to improve in-hospital care of your patients?

Figure 25: Survey form for trauma

What factors would make you more or less likely to use a computerized risk score during an EMS trauma response?

A large, empty rectangular box with a thin grey border, intended for the respondent to write their answer to the question above. A small diagonal line is visible in the bottom right corner of the box.

Is there anything else you'd like to share?

A large, empty rectangular box with a thin grey border, intended for the respondent to write any additional comments or information. A small diagonal line is visible in the bottom right corner of the box.
