

Supplemental Methods

1. Search terms

We used the same search terms used by Das et al. (2019) to search 16 international and 7 regional databases for studies published since that review was completed. We did not have access to WHOLIS and IndMed, so those databases were not included

Cochrane Central Register of Controlled Trials (CENTRAL) in the Cochrane Library

2. Methods to determine rainy vs. dry season

For each study we identified the GPS coordinates of an approximately central location within the study area. Using this location we retrieved the historical monthly rainfall data for that area from two online repositories. For rainfall information prior to 2017, data were extracted from the Global Precipitation Climatology Center at 0.5° resolution¹. Information for more recent years was extracted from the Climate Hazards Group Infrared Precipitation with Stations².

We computed average rainfall for 3-month time periods, defined as the “index” month (when the child assessment was conducted) and the two months prior to the index month. Then a k-means clustering analysis with k=2 groups was conducted to categorize “index” months into time periods with more precipitation vs time periods with less precipitation. These categorizations were then applied to the child-level month of assessment to determine a ‘Rainy’ vs ‘Dry’ season designation for each assessment of a given child.

Plots of average precipitation over time with the k-means categorizations were also visually assessed. The two studies conducted in Mali and Haiti were found to have little variation in precipitation and so were not assigned seasonality values.

Acknowledgements

Our approach was motivated by discussions and the preliminary work on related topics³ of Ben Arnold, Andrew Mertens, and Jack Colford.
