

Table 8. Supplemental overview of individual-level effect modification

Effect modifier	Plasma zinc	Retinol	Marginal retinol		RBP	Marginal RBP	
	GMR	GMR	PR	PD	GMR	PR	PD
Higher (vs. lower) maternal BMI							
Older (vs. younger) mother							
Higher (vs. lower) maternal education							
Female (vs. male) child							
Later-born (vs. first-born) child							
Acutely (vs. non-acutely) malnourished							
Anemic (vs. non-anemic)							
Received (vs. did not receive) Vitamin A							
No high (vs. high) AGP or CRP							(C)
Higher (vs. lower) SES							
Food secure (vs. insecure)							
Improved (vs. unimproved) water quality							
Improved (vs. unimproved) sanitation							
Rainy (vs. dry) season							

MD=mean difference; GMR=geometric mean ratio; PR=prevalence ratio; PD=prevalence difference. Green indicates stronger effect in the indicated subgroup while blue indicates a stronger effect in the other subgroup. Dark color indicates p -for-interaction < 0.05 ; light color indicates $0.05 < p < 0.1$. The letter "C" indicates that the apparent effect modification is due to the cutoff effect; when "C" is in parentheses, it is partially explained by the cutoff effect.
