

7 Supplementary Material

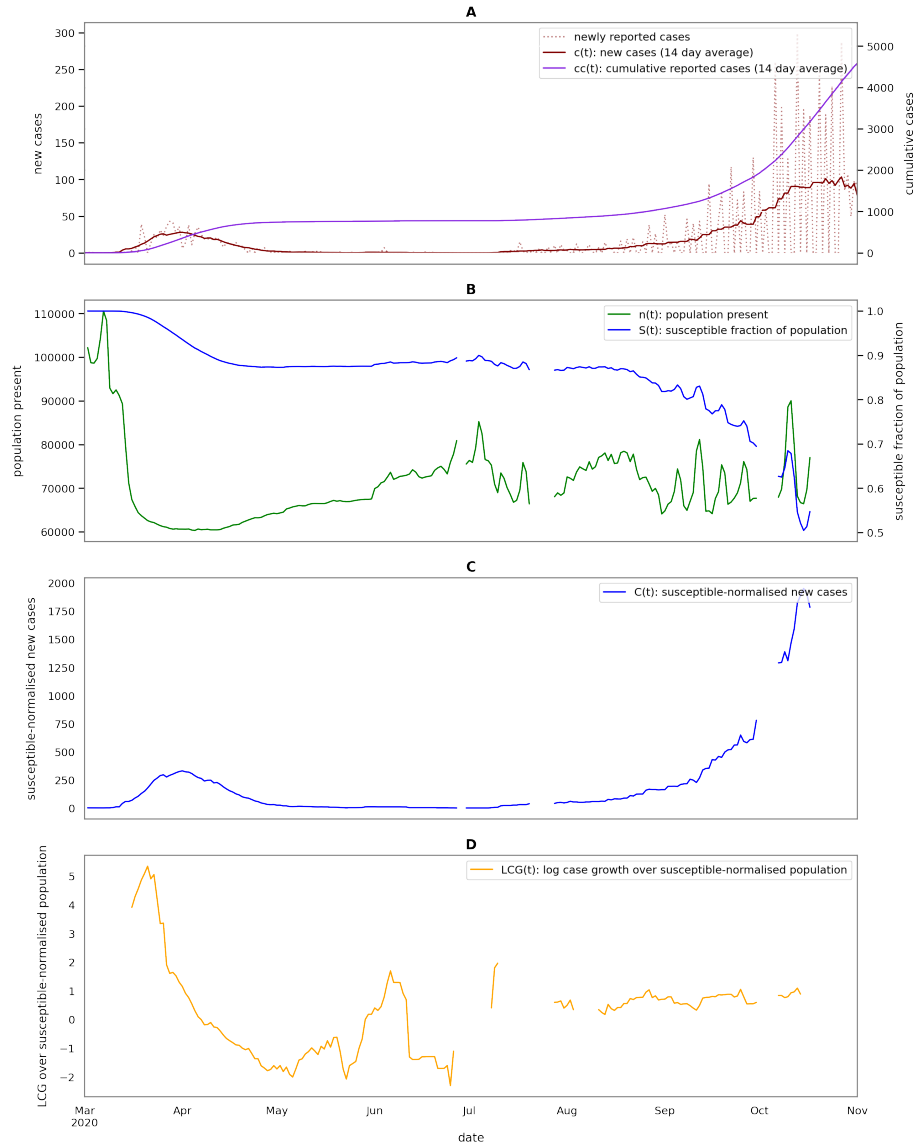

Figure 7.13: $LCG(t)$ as well as variables used in the calculation, as described in section 4.3.1: (A) Newly reported cases (not smoothed), $c(t)$: newly reported cases (14 day rolling average), $cc(t)$: cumulative reported cases (14 day rolling average), (B) $n(t)$: population present, $S(t)$: susceptible fraction of the population, (C) $C(t)$: The susceptible-normalised new cases per day, (D) $LCG(t)$: log of the growth in daily susceptible-normalised new cases since the 14 days prior.

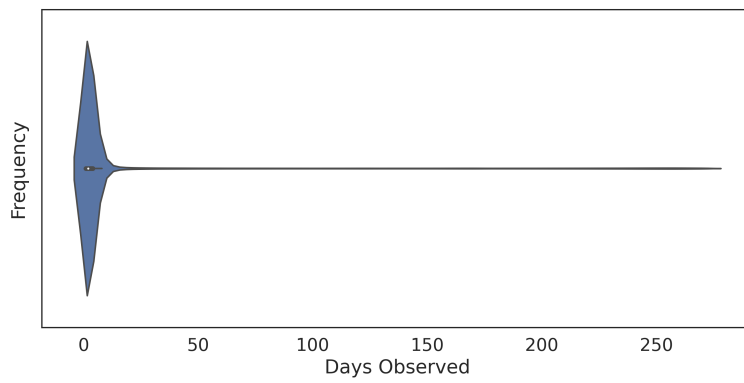

Figure 7.14: Distribution of number of days observed by subscriber. The distribution is dominated by tourists who significantly outnumber residents.

lag	indoor interac- tion poten- tial	outdoor interac- tion poten- tial	people making trips be- tween parishes	total trips be- tween parishes	fraction of people not staying home	people making trips	total trips	country en- trances

Table 3: The correlations between the daily time series of 8 mobility metrics and lagged log case growth (LCG). LCG is shifted by lags ranging from -30 to 30 days.
