

Supplemental Table 1: Performance of Clinical Evaluation

A) Clinical performance of the SARS-CoV-2 NGS Assay was evaluated by comparing results to an RT-PCR assay authorized by the FDA for use under Emergency User Authorization (EUA RT-PCR). 60 clinical nasopharyngeal swab (NP) specimens were tested, including 30 SARS-CoV-2-positive and 30 SARS-CoV-2-negative specimens. The positive and negative percent agreement was calculated in relation to the EUA RT-PCR comparator method and indicated in the following table.

		EUA RT-PCR Comparator Assay		% agreement (95% CI)
		Positive	Negative	
SARS-CoV-2 NGS Assay	Positive	29	0	PPA: 96.7% (90.6%-100%)
	Negative	1	29	NPA: 96.7% (90.6%-100%)
	Invalid	0	1	

**One PCR negative sample did not yield sufficient reads using the SARS-CoV-2 NGS Assay to be called negative, and labelled as INVALID.*

B) Additional independent validation set combined with previous validation data yielded the following performance characteristics:

		EUA RT-PCR Comparator Assay		% agreement (95% CI)
		Positive	Negative	
SARS-CoV-2 NGS Assay	Positive	57	0	PPA:95.2% (90%-100%)
	Negative	3	59	NPA: 98.3% (95.2%-100%)
	Invalid	0	1	

**One PCR negative sample did not yield sufficient reads using the SARS-CoV-2 NGS Assay to be called negative, and labelled as INVALID.*

Supplemental Table 2. The calculation of presence and absence of SARS-CoV-2 viral genome in a clinical validation and an independent clinical validation. We devised a metric to compute the integral under a curve created by calculating the coverage at 1X depth using a sliding window scheme (with a window size of 100 and step size of 10). This metric was then log transformed. We have set a threshold of 8.6 if samples had less than 10,000 bases on target or 9.5 if samples had more than 10,000 bases on target. Metrics were calculated using the R statistical software package (v4.0.1).

Presence: if SARS-CoV-2 was detected. We devised a metric (I1) to compute the integral under a curve created by calculating the coverage at 1X depth using a sliding window scheme (with a window size of 100 and step size of 10). This metric was then log transformed. We have set a threshold of 8.6 if samples had less than 10,000 bases on target or 9.5 if samples had more than 10,000 bases on target. Metrics were calculated using the R statistical software package (v4.0.1). X1-X500: percent coverage at 1X-500X depths, used internally to inform the analysis. E1: evenness, used internally to inform the analysis. I1: integral. The following H5 metrics are reported: bait territory, percent of selected bases, target territory, genome size, total reads and on target bases. Red indicates deviant results. Additionally, the number of reads mapped to the human genome will provide an internal control on each individual sample to be called valid.

Subsampling data. We subsampled each of the four FASTQs down to a maximum of 125,000 reads totaling up to 500,000 reads for the full set of four FASTQs per sample. If a FASTQ had fewer than 125,000 reads, it was not

Supplemental Table 4. The preliminary LoD was established by testing 10-fold dilutions of SARS-CoV-2 synthetic RNA using two different synthetic constructs in duplicates. The preliminary LoD was confirmed by testing triplicates of 2-fold dilutions (2500 copies/ml, 1200 copies/ml, 640 copies/ml, 320 copies/ml, 160 copies/ml, 80 copies/ml, and 40 copies/ml) of spiking a quantitative heat-inactivated SARS-CoV-2 into negative respiratory clinical matrices. The LOD was determined to be 800 copies/ml. The LOD (800 copies/ml) was replicated 30 times. 29/30 (96.67%) samples were positive.

Presence of SARS-CoV-2 was detected. We devised a metric (E) to compute the integral under a curve created by plotting the coverage at 1X depth using a sliding window scheme (with a window size of 100 and step size of 10). This metric was then log transformed. We have set a threshold of 8.5 for samples with less than 15,000 bases on target or 9.5 for samples with more than 15,000 bases on target. Metrics were calculated using the R statistical software package (v4.0.1). X1-X50: percent coverage at 1X-50X depths, used internally to inform the analysis. E1: evenness, used internally to inform the analysis. I1: integral. The following H5 metrics are reported: Bait territory, percent of selected bases, territory, genome size, total reads and on target bases. Red indicates deviant results. Additionally, the number of reads mapped to the human genome for each individual sample to be called valid.

Supplemental Table 5. In-silico studies inclusivity and exclusivity study included GISAID, NCBI Viral and a combined genome dataset. The total number of sequences with different percent identity is shown in the table. To account for potential cross-reactivity of the SARS-CoV-2 NGS hybridization primers, we aligned reads to 29 microbial genomes and the human genome along with the SARS-CoV-2 genome. All pathogens were determined to have no cross-reactivity (no more than 80% homology) with the primers used, except human coronavirus HKU1 with 3 out of 994 probes with 84.6% homology.

Supplemental Table 6. NGS Variant Analysis and Annotation of 71 COVID Positive Samples. We detected 733 mutations (261 different mutations) at 258 different mutation sites. Out of these mutations, 153 were previously reported and we identified 107 new mutations. The annotation provides information on the mutation name, gene location, protein name, amino acid change (NCBI) and synonymy. We provided information on the frequency of genetic variants in our sample cohort and the associated read depth. We used the Grantham scoring system to designate conservative and radical mutations. In this system the score of 100 and above calls mutations radical.

Supplemental Table 7. Validation data of SARS-CoV-2 genetic variants, *Prevotella* spp. and the primer sets. (A) To validate the variant calling of our assay and software, we selected 3 genetic regions containing mutations identified by our protocol. The genetic regions were PCR amplified using specifically designed primers followed by Sanger sequencing. The mutations for validation were selected using the following considerations: read depth, location, synonymy, Grantham score and AA (aminoacid replacement). Most new mutations (not yet reported by GISAID by November 11, 2020) were observed in the ORF1ab and S gene regions. One of the specific TN mutations (T6394C) was not reported by GISAID, and also included in the selection from the ORF1ab region. The primer design considered nearby mutations to the selected variants in order to maximize the validation efficiency of the sequencing reaction. The mutations that were primarily selected are highlighted in bold. (B) Metagenomic validation of *Prevotella* spp., PCR amplification conditions and primer set.

A. Validation of SARS-CoV-2 genetic variants and primer sets.								
Mutations	Read Depth	Location	Protein	Synonymy	Grantham	AA change	Forward Primer	Reverse Primer

B. <i>Prevotella</i> 16s rDNA primer set.								
<i>Prevotella</i> spp.	PCR amplification was performed with 1x KAPA-HiFi polymerase Ready Mix, 250nM of each primer, 1 ng of DNA input with the following cycling conditions: 95°C for 3 minutes, 35 cycles of 98°C for 20 seconds, 58°C for 15 seconds, 72°C for 1 minute; 72°C for 5 minutes.						5'-GGG ATG CGT CYG ATT AGB YWG YH-3'	5'-SCY TAG GYC GHY CCT YSC GGT-3'

Supplemental Table 8. Relevant Functional Metagenomic Profiles Obtained from HUMAnN2 Analysis. We detected a total of 434 functional pathways in our data set, of which 4 were found to be increased in CVN samples and 3 in CVP samples. Additionally we have listed the functional pathways associated to those bacterial species significantly increased in CVP samples with LEfSE analysis.

Pathway ID MetaCyc	Pathway name	Taxa	COVID-Status
PWY-6168	flavin biosynthesis III (fungi)	Bacillus subtilis	CVP

THRESYN-PWY	superpathway of L-threonine biosynthesis	Megasphaera micronuciformis	NA
PWY-7219	adenosine ribonucleotides de novo biosynthesis	Megasphaera micronuciformis	NA
PEPTIDOGLYCANSYN-PWY	peptidoglycan biosynthesis I (meso-diaminopimelate cont	Megasphaera micronuciformis	NA
PWY-4242	pantothenate and coenzyme A biosynthesis III	Megasphaera micronuciformis	NA
PWY-6608	guanosine nucleotides degradation III	Megasphaera micronuciformis	NA
PWY-6387	UDP-N-acetylmuramoyl-pentapeptide biosynthesis I (meso-	Megasphaera micronuciformis	NA
COA-PWY-1	coenzyme A biosynthesis II (mammalian)	Megasphaera micronuciformis	NA
PWY-6897	thiamin salvage II	Megasphaera micronuciformis	NA
PWY-5686	UMP biosynthesis	Megasphaera micronuciformis	NA
PWY-2942	L-lysine biosynthesis III	Megasphaera micronuciformis	NA
PWY-5097	L-lysine biosynthesis VI	Megasphaera micronuciformis	NA
PWY-1296	purine ribonucleosides degradation	Megasphaera micronuciformis	NA
PWY-7357	thiamin formation from pyriothiamine and oxythiamine (ye	Megasphaera micronuciformis	NA
PWY-6122	5-aminoimidazole ribonucleotide biosynthesis II	Megasphaera micronuciformis	NA
PWY-6277	superpathway of 5-aminoimidazole ribonucleotide biosyn	Megasphaera micronuciformis	NA
PWY-724	superpathway of L-lysine, L-threonine and L-methionine b	Megasphaera micronuciformis	NA
PWY-6121	5-aminoimidazole ribonucleotide biosynthesis I	Megasphaera micronuciformis	NA
PWY-5667	CDP-diaclyglycerol biosynthesis I	Megasphaera micronuciformis	NA
PWY-1319	CDP-diaclyglycerol biosynthesis II	Megasphaera micronuciformis	NA
PWY-6386	UDP-N-acetylmuramoyl-pentapeptide biosynthesis II (lysi	Megasphaera micronuciformis	NA
PWY-6385	peptidoglycan biosynthesis III (mycobacteria)	Megasphaera micronuciformis	NA
PWY-6700	queuosine biosynthesis	Megasphaera micronuciformis	NA
PWY-6703	preQ0 biosynthesis	Megasphaera micronuciformis	NA
PWY-6147	6-hydroxymethyl-dihydropterin diphosphate biosynthesis	Megasphaera micronuciformis	NA
PWY-7219	adenosine ribonucleotides de novo biosynthesis	Atopobium parvulum	NA
PWY-1296	purine ribonucleosides degradation	Atopobium parvulum	NA
DTDRPHAMSYN-PWY	dTDP-L-rhamnose biosynthesis I	Atopobium parvulum	NA
PWY-2942	L-lysine biosynthesis III	Atopobium parvulum	NA
PWY-6609	adenine and adenosine salvage III	Atopobium parvulum	NA
PWY-5686	UMP biosynthesis	Atopobium parvulum	NA
PWY-7221	guanosine ribonucleotides de novo biosynthesis	Atopobium parvulum	NA
ASPASN-PWY	superpathway of L-aspartate and L-asparagine biosynthes	Atopobium parvulum	NA
PWY-6386	UDP-N-acetylmuramoyl-pentapeptide biosynthesis II (lysi	Atopobium parvulum	NA
PWY-1586	peptidoglycan maturation (meso-diaminopimelate contair	Atopobium parvulum	NA
COA-PWY-1	coenzyme A biosynthesis II (mammalian)	Atopobium parvulum	NA
