

Supplementary Figure 1. The effect of sample treatment conditions on saliva lithium levels. Known lithium concentrations were spiked into saliva samples from five psychiatric patients, and tested for the impact of saliva collection method (passive drool vs. swab), processing (centrifuged or 'spun' vs non-centrifuged or 'unspun'), or storage for 24 hours at room temperature (RT), vs 4°C vs -20°C. All comparisons other than that of saliva collection method were conducted using the passive drool samples.

Supplementary Figure 2. Correlation of the variation in saliva/serum ratios across any two visits with age. Spearman correlation,  $r=0.397$ ;  $p=0.0001$ .

Supplementary Table 1. Summary of the saliva/serum ratios of patients attending multiple visits.

Record number	Lithium dose/day	Appt. 1	Appt. 2	Appt. 3	Appt. 4	Appt. 5	Appt. 6	Appt. 7
