## Cortical Thickness Models

Note - Measures of heterogeneity

Tau<sup>2</sup>: Represents the absolute value of the true variance of the effect sizes, between-study variance

The I<sup>2</sup> statistic: Represents the proportion (in percentage) of total variation in the estimates that can be attributed to heterogeneity among the effects rather than sampling variability. The I<sup>2</sup> may be interpreted according to the following ranges I<sup>2</sup> = 0-40%: low heterogeneity, I<sup>2</sup> = 30-60%: moderate heterogeneity, I<sup>2</sup> = 50-90%: substantial heterogeneity, I<sup>2</sup> = 75-100%: considerable heterogeneity

The H<sup>2</sup> statistic: Represents the ratio of the total amount of variability in the effect size estimates to the amount of sampling variability

## Cortical Surface Models

Note - Measures of heterogeneity

Tau<sup>2</sup>: Represents the absolute value of the true variance of the effect sizes, between-study variance

The I<sup>2</sup> statistic: Represents the proportion (in percentage) of total variation in the estimates that can be attributed to heterogeneity among the effects rather than sampling variability. The I<sup>2</sup> may be interpreted according to the following ranges I<sup>2</sup> = 0-40%: low heterogeneity, I<sup>2</sup> = 30-60%: moderate heterogeneity, I<sup>2</sup> = 50-90%: substantial heterogeneity, I<sup>2</sup> = 75-100%: considerable heterogeneity

The H<sup>2</sup> statistic: Represents the ratio of the total amount of variability in the effect size estimates to the amount of sampling variability

## Subcortical Models

Note - Measures of heterogeneity

Tau<sup>2</sup>: Represents the absolute value of the true variance of the effect sizes, between-study variance

The I<sup>2</sup> statistic: Represents the proportion (in percentage) of total variation in the estimates that can be attributed to heterogeneity among the effects rather than sampling variability. The I<sup>2</sup> may be interpreted according to the following ranges I<sup>2</sup> = 0-40%: low heterogeneity, I<sup>2</sup> = 30-60%: moderate heterogeneity, I<sup>2</sup> = 50-90%: substantial heterogeneity, I<sup>2</sup> = 75-100%: considerable heterogeneity

The H<sup>2</sup> statistic: Represents the ratio of the total amount of variability in the effect size estimates to the amount of sampling variability
