Pregnancy-induced changes in blood composition drive post-partum hemorrhage risk

Matthew R. Robinson, Marion Patxot, Miloš Stojanov, Sabine Blum, David Baud

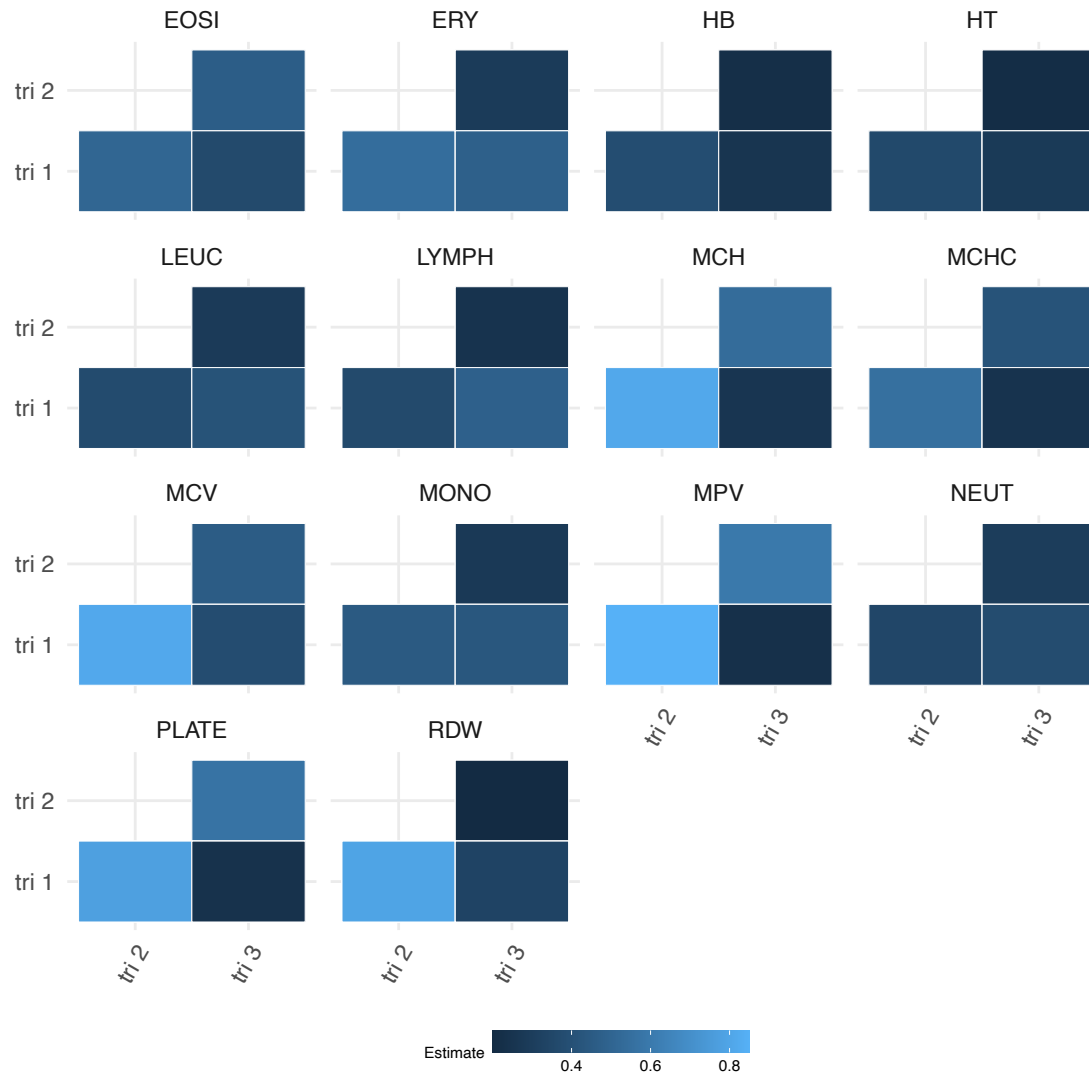

Figure S1. Path coefficients of trimester-specific complete blood count values. Path relationships between complete blood count measures indicating the strength of relationship (on the correlation scale) of measures recorded across the three trimesters of pregnancy. Measure abbreviations: absolute eosinophil (EOSI), lymphocyte (LYMPH), monophil (MONO) and neutrophil (NEUT) levels; leukocyte count (LEUC), erythrocyte count (ERY), hematocrit (HT), hemoglobin level (HB), mean corpuscular hemoglobin (MCH) and the concentration (MCHC), mean corpuscular volume (MCV), mean platelet volume (MPV), platelet count (PLATE), and red cell distribution width (RDW)
