### Discussion of Mediation Models

Total-effect models differ fundamentally from mediation models, and the absence of a total effect does not necessarily indicate the absence of theoretically-sound mediated effects, though these should be interpreted cautiously<sup>1,2</sup>. Following Zhao et al.'s typology of mediation effects<sup>1</sup>, our findings suggested indirect-only mediation for all occupational groups except for healthcare workers and indoor trade, process and plant occupations. Direct effects were observed in the mediation model for the latter groups, consistent with complementary mediation<sup>34</sup> and suggesting the presence of further indirect effects unaccounted for in the model.
