| S. Table 8     | Ranges of static activity values for each motion feature                                                                              | 22      |

**S. Fig. 1. Count histograms of accelerometry recording information.** The histograms (n = 69, 25 uniform partitions) display the distributions of (**a**) accelerometry recording duration in hours, (**b**) delay between ICU admission and start of accelerometry recording in days, (**c**) proportion of ICU stay during which accelerometry recording took place, and (**d**) proportion of ICU stay that elapsed before accelerometry recording began.

Supplementary Figure 2 (part 1 of 3)

S. Fig. 2. Trajectories of motor component scores of the Glasgow Coma Scale (GCSm) of each study participant during ICU stay. Shaded areas represent time ranges during which we recorded accelerometry from the corresponding patient and points mark the exact times of a GCSm evaluation.

**Supplementary Table 2**: Discrimination of threshold-level GCSm detection models per observation window.

Values in the five rightmost columns represent mean validation set area under the receiver operating characteristic curve (AUC) values with associated 95% confidence intervals in parentheses. Confidence intervals were derived using bias-corrected bootstrapping (1,000 resamples) and represent the variation across repeated cross-validation folds (5 repeats of 5 folds) and nine missing value imputations. Missing values designate insufficient diversity in endpoint labels to evaluate models of that observation window and threshold combination.

### **Supplementary Table 4**: Discrimination of threshold-level GOSE at hospital discharge prediction models per observation window.

Values in the five rightmost columns represent mean validation set area under the receiver operating characteristic curve (AUC) values with associated 95% confidence intervals in parentheses. Confidence intervals were derived using bias-corrected bootstrapping (1,000 resamples) and represent the variation across repeated cross-validation folds (5 repeats of 5 folds) and nine missing value imputations. Missing values designate insufficient diversity in endpoint labels to evaluate models of that observation window and threshold combination.

**S. Fig. 3. Precision recall curve and prediction distribution of GOSE (discharge) > 5 prediction. a** Precision recall curve of optimally discriminating model configuration of GOSE > 5 prediction at hospital discharge (**Fig. 3a**). Shaded areas (not visible) represent 95% confidence intervals derived using bias-corrected bootstrapping (1,000 resamples) to represent the variation across repeated cross-validation folds (5 repeats of 5 folds) and nine missing value imputations. The values in the box represent the observation window of the optimally discriminating model as well as the mean average precision (with 95% confidence interval in parentheses). **b** Density histograms of predicted probabilities for positive cases (upward) and negative cases (downward) of GOSE > 5 prediction at hospital discharge. *n* represents the number of unique observations pertaining to each case and the range of predicted probabilities is fixed on a narrow, near-zero range to demonstrate the low predicted probabilities of the model.

## **Supplementary Table 5**: Count distributions of GOSE scores at 12 months post discharge per observation window.

**S. Fig. 4. Discrimination performance of functional outcome at 12 months post discharge prediction models on validation sets.** a Receiver operating characteristic (ROC) curves of models pertaining to the observation windows with the highest achieved area under the ROC curve (AUC) per each tested prediction threshold of the Glasgow Outcome Scale – Extended (GOSE). Shaded areas represent 95% confidence intervals derived using bias-corrected bootstrapping (1,000 resamples) to represent the variation across repeated cross-validation folds (5 repeats of 5 folds) and nine missing value imputations. The values in each box represent the observation window achieving the highest AUC as well as the corresponding mean AUC (with 95% confidence interval in parentheses). The diagonal dashed line represents the line of no discrimination (AUC = 0.5). **b** AUC vs. observation windows up to 18 hours per each tested predicted threshold of the Glasgow Outcome Scale – Extended (GOSE). Points represent observation windows tested and error bars (with the associated shaded region) represent the 95% confidence interval. The horizontal dashed line corresponds to no discrimination (AUC = 0.5).

### **Supplementary Table 6**: Discrimination of threshold-level GOSE at 12 months post discharge prediction models per observation window.

Values in the seven rightmost columns represent mean validation set area under the receiver operating characteristic curve (AUC) values with associated 95% confidence intervals in parentheses. Confidence intervals were derived using bias-corrected bootstrapping (1,000 resamples) and represent the variation across repeated cross-validation folds (5 repeats of 5 folds) and nine missing value imputations. Missing values designate insufficient diversity in endpoint labels to evaluate models of that observation window and threshold combination.

**S. Fig. 5. Mean motion feature trajectories in the six hours preceding GCSm evaluation, stratified by GCSm scores and bilateral sensor placement.** The figure represents the trajectories of features from 488 6-hour observation windows across 68 unique patients. Features have been binned in uniform 10minute intervals preceding GCSm evaluation and outliers (values extending beyond three times the interquartile range above the third quartile of each combination of feature type and bilateral placement) were removed prior to calculation of the mean values. Shaded areas represent the 95% confidence interval bootstrapped from 1,000 resamples to represent the variation across unique GCSm observations. The solid dark red line on the rightmost edge of each graph represents the time of GCSm evaluation. Feature type acronyms are decoded in **Table 4**.

S. Fig. 7. Violin plots of extracted motion feature values (30 min observation window), stratified by bilateral sensor placement and GCSm scores. The figure represents the distribution of features from 636 observation windows across 68 unique patients. Outliers, defined as values extending beyond two times the interquartile range above the third quartile, were removed from the plot. Means of numerical distributions per GCSm score were each compared against the compiled distribution mean of all GCSm scores using the Wilcoxon signed-rank test. Statistically significant differences are marked with asterisks (\* $p \le 0.05$ , \*\* $p \le 0.01$ , \*\*\* $p \le 0.001$ , \*\*\*\* $p \le 0.0001$ ). Feature type acronyms are decoded in Table 4.

**S. Fig. 8. Bode plot of filter used in accelerometry processing.** *(top)* Magnitude response and *(bottom)* phase response of the 4<sup>th</sup> order Butterworth high-pass filter ( $f_c = 0.2$  Hz) used to filter out baseline offsets and static orientation from raw accelerometry ( $f_s = 10$  Hz).

**S. Fig. 9. Percentages of missing, static, and dynamic accelerometry data by time of day of recording and sensor placement.** The complete accelerometry information (1,701 hours) across all patients (n = 69) in the study were used to create this figure. The red line represents the percentage of missing data per time of day and the blue line represents percentage of missing data plus the percentage of static activity (SMA < 0.135 g) per time of day. Thus, the light grey shaded area represents the percentage of total missing data, the light cyan shaded area represents the percentage of total static activity, and the light green shaded area (barely visible) represents the percentage of total dynamic activity.

Recording duration is specified in hours:minutes:seconds. The total percentage of missing data, across all patients and all sensors, is 6.76% (excluding bed sensor: 5.91%).

Supplementary Table 8: Ranges of static activity values for each motion feature.

| Feature          | Minimum Value | Maximum Value |
|------------------|---------------|---------------|
| SMA              | 0.000         | 0.135         |
| HLF <sub>h</sub> | 0.000         | 0.008         |
| HLF              | 0.000         | 0.006         |
| MFR              | 1.630         | 3.200         |
| FDE              | 1.630         | 1.710         |
| BPW              | 0.000         | 0.012         |
| WVL              | 0.000         | 1.000         |

The maximum value (0.135) of SMA was proposed by Lugade et al. For the remaining feature spaces, we determined the threshold of dynamic activity by minimizing the Euclidean norm of the proportion of static activity across the patient set with that of the SMA threshold.
