

Non-pharmaceutical interventions and the emergence of pathogen variants

SUPPLEMENTARY MATERIAL

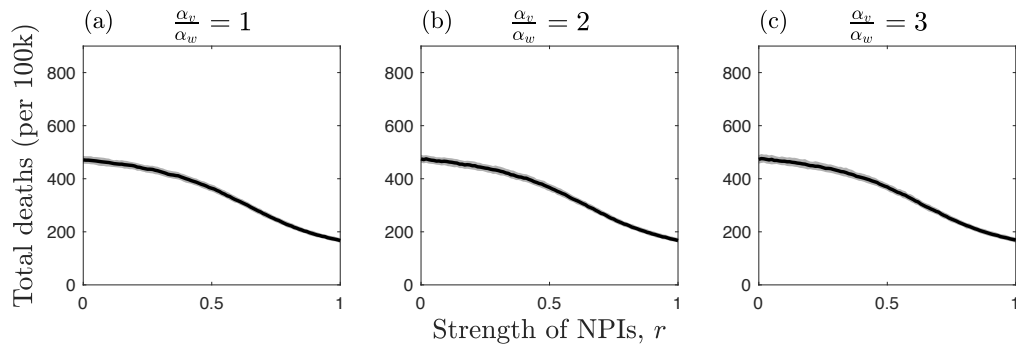

Figure S1 – Effects of NPIs (r) and the relative mortality (α_v/α_w) of a more transmissible variant ($\beta_v/\beta_w = 1.5$) on total deaths (per 100k) when there is full cross immunity ($c = 1$) and NPIs are delayed ($\epsilon = 0.2$). Plots show the median (black) along with the upper and lower quartiles (grey) over 100 simulations. Other parameters as described in the main text.
