Supplementary methods

Multilevel regression and poststratification to estimate $P_{Y,Z}(Y,Z)$ and establish socio-demographic determinants of Y|Z and Z

We wish to estimate the joint distribution $P_{Y,Z}(Y,Z)$, where Y denotes change in vaccination inclination if vaccine passports were introduced for use domestically for social events (or, using the same notation but an independent model implementation, for international use) and Z denotes each individuals' baseline intent to accept a COVID-19 vaccine. Both Y and Z are modelled as ordinal random variables. We want to obtain the posterior predictive distribution $P_{Y',Z'|Y,Z}(Y',Z'|Y,Z) = \mathbb{E}_S P_{Y'|Y,Z,S}(Y'|Y,Z,S)P_{Z'|X}(Z'|S)$, where S is an index variable that represents one of the $N_S = 370,440$ unique census strata (12 regions \times 2 sexes \times 7 age groups \times 3 education levels \times 7 work statuses \times 7 religious affiliations \times 5 ethnicities \times 3 primary languages). Thus,

$$P_{Y/Z/}(Y',Z'|Y,Z) = \sum_{s=1}^{N_S} P_{Y/|Y,Z/S}(Y'|Y,Z,S=s) P_{Z/|X}(Z'|S=s) P_S(S=s). \tag{1}$$

The first two elements on the right-hand side of equation (1) are estimated via posterior predictive distributions,

$$P_{Y/|Y,Z,S}(Y'|Y,Z,S) = \int P_{Y|Z,S,\theta}(Y'|Z,S,\theta)P_{\theta|Z,S,Y}(\theta|Z,S,Y)d\theta$$
(2)

$$P_{Z'|Z,S}(Z'|Z,S) = \int P_{Z'|Z,S}(Z'|Z,S,\tilde{\theta})P_{\tilde{\theta}|Z,S}(\tilde{\theta}|Z,Y)d\tilde{\theta}$$
(3)

obtained from two separate multilevel regressions, where both regression models deploy ordinal logistic regressions (see below) and where $P_{\theta|Z,S,Y}(\theta|Z,S,Y)$ and $P_{\tilde{\theta}|Z,S}(\tilde{\theta}|Z,Y)$ denote posterior distributions over all model parameters θ . The last term of equation (1) simply counts the number of unique strata in the UK census records and divides by the total number of individuals, $P_S(S=s)=\#(S=s)/N$. That is, this final term implements post-stratification according to UK census microdata records.

Multilevel ordinal logistic regression is used to model Y|Z, S,

$$Y_j(i)|Z_j(i), S_j(i) \sim \text{OrderedLogistic}(\beta_Z \sum_{i=1}^{Z_j(i)-1} \delta_{ij} + f(S_j(i); \boldsymbol{\beta}_j); \tau_1, \tau_2, \tau_3, \tau_4)$$
 (5)

where $Y_j(i) \in \{1,2,3,4,5\}$ denotes the change in inclination for individual i in sub-national region j (where, as a reminder, 1=much less likely and 5=much more likely, see main text table 1); $S_j(i)$ denotes individuals' socio-demographic characteristics; the term $\beta_Z \sum_{i=1}^{Z_j(i)-1} \delta_{ij}$ models that $Z_j(i) \in \{1,2,3,4\}$ is an ordinal covariate⁴¹; and where $\delta_{ij} \geq 0$ and $\sum_{i=1}^4 \delta_{ij} = 1 \ \forall j, -\infty < \tau_1 < \tau_2 < \tau_3 < \tau_4 < \infty$. We use the ordered logistic distribution for k ordered outcomes specified by $Y \sim 0$ ordered Logistic $(\beta; \tau_1, \tau_2, ..., \tau_{k-1})$, where $P_Y(Y \leq k) = \sigma(\tau_k - \beta)$ and $\sigma(x) = 1/(1 + e^{-x})$ is the standard logistic sigmoid function. This definition is equivalent to the proportional-odds assumption, wherein the difference in the log of cumulative odds ratios between successive categories is independent of the slope β . The function $f(S_j(i); \beta_j) = \beta_{sex(i),j} + \beta_{age(i),j} + \beta_{eta(i),j} + \beta_{ret(i),j} + \beta_{eth(i),j} + \beta_{tan(i),j}$, where $\forall d \in D = \{sex, age, edu, rel, wrk, eth, lan\}, d(i)$ corresponds to the category to which i belongs and $\beta_{d(i)} = 0$ if d(i) is a baseline group (male, aged 18-24, with level 1-3 education, a Christian, in full-time employment, White ethnicity, and speaks English/Welsh/Scottish as a first language—see main text table 1 for full definitions).

Regularising priors are placed on all socio-demographic fixed-effect parameters $\beta_{k,j} \sim N(\gamma_k, p_k)$ (where $p_k = \frac{1}{\sigma_k^2}$ is the precision) and $p_k \sim Gamma(1,.1)$ places a relatively uniform prior over corresponding values for $\sigma_i > 1$, with less prior mass assigned as σ_i decreases from 1 towards 0. (Here k indexes over all random-effect parameters d.) $\gamma_k \sim N(0, 10^{-1}) \forall k$, which places a semi-informative prior over fixed-effect parameters with variance equal to 10.

In addition, the second term in equation (1) is modelled as,

$$Z_i(i)|S_i(i) \sim OrderedLogistic(f(S_i(i); \boldsymbol{\beta'}_i); \tau'_1, \tau'_2, \tau'_3, \tau'_4), \tag{6}$$

with the same conditions on the τ parameters in the ordered logistic function as specified above and with $f(S_j(i); \boldsymbol{\beta'}_j) = \beta'_{sex(i),j} + \beta'_{age(i),j} + \beta'_{edu(i),j} + \beta'_{rel(i),j} + \beta'_{wrk(i),j} + \beta'_{eth(i),j} + \beta'_{lan(i),j}$. This multilevel ordinal logistic regression

estimates the relationship between socio-demographic factors and baseline intent to accept a COVID-19 vaccine. The prime notation distinguishes the parameters from those in equation (5). The same prior distributions are used as for the fixed- and random-effect parameters for equation (5).

We also estimate the determinants of change in vaccination inclination directly (that is, without controlling for baseline vaccination intent) via,

$$Y_i(i)|S_i(i) \sim OrderedLogistic(f(S_i(i); \boldsymbol{\beta}^{"}_i); \tau^{"}_{1}, \tau^{"}_{2}, \tau^{"}_{3}, \tau^{"}_{4}), \tag{7}$$

where all parameters and respective priors are as defined above, but the double primed notation differentiates parameters between models.

Multilevel regression and poststratification to estimate responses to the seven-item battery on vaccinations and societal freedoms

Multilevel regression and poststratification is also used to estimate national-level sentiment and the socio-demographic determinants of the seven questions outlined in the main text. Seven individual MRP models are implemented to simultaneously estimate national attitudes to these statements and to explore their socio-demographic determinants. These models follow the same process as per equation (1), but instead we estimate $P_{Z_q'}(Z_q'|Z_q)$, where Z_q denotes the response to one of the seven statements: (1) Proof of vaccination via a vaccine certificate or passport for social events infringes on personal liberties; (2) I wish to be free to reject a vaccine without consequences on my ability to attend public or social events; (3) Individuals who reject a vaccine should not be allowed to attend social events; (4) Private companies should have the right to reject individuals if they have not received a vaccine; (5) Private companies should have the right not to employ unvaccinated staff; (6) Overall, I think vaccine passports are a good idea; (7) Requiring vaccine certificates or passports for social events is the same as requiring me to get vaccinated.

Estimating age-stratified intention to accept a COVID-19 vaccine using data from October 2020

In October 2020, a nationally representative survey of 16,820 UK adults conducted in October 2020 asked respondents 'If a new coronavirus (COVID-19) vaccine became available, would you accept the vaccine for yourself?' with the same four possible responses as provided in this study (that is, 'yes, definitely', 'unsure, but leaning towards yes, 'unsure, but leaning towards no, and 'no, definitely not'). These data are used in the main text discussion to assess whether age-specific intent recorded in October 2020 matched uptake among individuals over 55, to thus establish whether a possible key limitation of the study—social desirability biases—may play a strong limiting factor in our analysis.

Intent to accept a COVID-19 vaccine in October 2020 in the UK is estimated for each of three birth cohorts who have all been offered a COVID-19 vaccine at the time of the study. These birth cohorts are: 55-64 (n=2,059), 65-79 (n=2,623), and 80+ year-olds (n=157). Uptake intent (as measured in October 2020) is estimated using the model, $Y_c \sim Multinom(\pi_c, n_c)$, with $\pi_c \sim Dirichlet(1,1,1,1)$, where $Y = (Y_1, Y_2, Y_3, Y_4)$ is the number of respondents falling into each of the four categories (1 = 'No, definitely not', 2='Unsure, but leaning towards no', 3='Unsure, but leaning towards yes', 4='Yes, definitely').

Supplementary figures and tables

Figure 1 | Socio-demographic determinants of baseline vaccination intent, *Z.* Multilevel regression fixed-effect parameter log odds ratios are plotted with corresponding 95% highest posterior density intervals. Log odds ratios are coloured by effect magnitude and direction, where blues (reds) signify that the group is more (less) inclined than the baseline group to accept a COVID-19 vaccine and the darker the colour the stronger the association. For each factor, the baseline group is provided in parentheses on the left. Odds ratios with 95% HPDIs are shown on the right for each parameter.

Figure 2 | MRP estimates of seven-item battery on attitudes to vaccinations, passports, and societal freedoms Percentage of the UK population who have not yet received both doses who agree to seven statements on vaccinations, passports, and societal freedoms. Horizontal bars denote 95% highest posterior density intervals. Overall agreement (disagreement)—that is the sum of 'strongly agree' ('strongly disagree') and 'tend to agree' ('tend to disagree')—to the seven statements is as follows: Requiring vaccine certificates or passports for social events is the same as requiring me to get vaccinated (agree: 35.5% [32.9 to 38.3]; disagree: 41.1% [38.2 to 43.8]); I wish to be free to reject a vaccine without consequences on my ability to attend public or social events (agree: 33.2% [30.7 to 35.8]; disagree: 39.3% [36.6 to 42.1); Individuals who reject a vaccine should not be allowed to attend social events (agree: 50.8% [47.4 to 54.0]; disagree: 24.9% [22.4 to 27.3]; Private companies should have the right to reject individuals if they have not received a vaccine (agree: 50.5% [47.0 to 53.9]; disagree: 25.1% [22.6 to 27.8]; Private companies should have the right not to employ unvaccinated staff (agree: 46.8% [43.5 to 50.11]; disagree: 27.9% [25.3 to 30.7]); Overall, I think vaccine passports are a good idea (agree: 59.8% [56.8 to 62.6]; disagree: 20.3% [18.3 to 22.3]); Requiring vaccine certificates or passports for social events is the same as requiring me to get vaccinated (agree 58.4% [55.3 to 61.6]; disagree 18.0% [16.0 to 19.9]).

Figure 3 | Socio-demographic determinants of the seven-item battery on attitudes to vaccinations, passports, and societal freedoms Multilevel regression fixed-effect parameter log odds ratios are plotted with corresponding 95% highest posterior density intervals. Log odds ratios are coloured by effect magnitude and direction, where blues (reds) signify that the group is more (less) inclined than the baseline group to accept a COVID-19 vaccine and the darker the colour the stronger the association. For each factor, the baseline group is provided in parentheses on the left. Odds ratios with 95% HPDIs are shown on the right for each parameter.

Figure 4 | Socio-demographic determinants of the seven-item battery on attitudes to vaccinations, passports, and societal freedoms (sensitivity analysis) Figures are as described in appendix, figure 3. All individuals are included in these regressions, but individuals who were previously removed for stating that they 'prefer not to say' (appendix, figure 3) are instead recoded to 'neither agree nor disagree'. The results are quantitatively similar.

If a coronavirus (COVID-19) vaccine was required to attend social events in the UK (such as sports events, theatres, pubs, or restaurants), would you be more or less inclined to accept a coronavirus (COVID-19) vaccine?

If a coronavirus (COVID-19) vaccine was required for international travel, would you be more or less inclined to accept a coronavirus (COVID-19) vaccine?

Questionnaire

| DEM We will begin by asking you some questions about yourself |
|---|
| Js |
| DEMAGENUM How old are you? |
| ▼ 18 (1) 100 (83) |
| |
| ×4 |
| DEMREG Which UK region do you live in? |
| ▼ East Midlands (1) Other (for example, Jersey, Guernsey, Isle of Man) (13) |
| |
| DEMSEX I am |
| ○ Male (1) |
| Female (2) |
| Other (3) |
| DEMEDU What is the highest level of education you have completed? (Select the response that best applies) |
| O No academic qualifications (1) |
| O-4 GCSE, O-levels, or equivalents (2) |
| 5+ GCSE, O-levels, 1 A level, or equivalents (3) |
| O Apprenticeship (4) |
| 2+ A levels or equivalents (5) |
| Undergraduate or postgraduate degree, or other professional qualification (6) |
| Other (e.g. vocational, foreign qualifications) (7) |
| O Do not know (8) |
| O Do not wish to answer (9) |

| DEMWRK Which of the following best describes your work status 6 months ago? | | | | |
|---|--|--|--|--|
| Working full-time (including self-employed) (1) | | | | |
| Working part-time (including self-employed) (2) | | | | |
| Unemployed (3) | | | | |
| O Student (4) | | | | |
| Cooking after the home (5) | | | | |
| Retired (6) | | | | |
| Unable to work (including, for example, a short- or long-term disability) (9) | | | | |
| O Do not wish to answer (8) | | | | |
| | | | | |
| | | | | |
| DEMREL Do you consider yourself | | | | |
| DEMREL Do you consider yourself Christian (1) | | | | |
| | | | | |
| O Christian (1) | | | | |
| Christian (1) Hindu (2) | | | | |
| Christian (1) Hindu (2) Muslim (3) | | | | |
| Christian (1) Hindu (2) Muslim (3) Jewish (4) | | | | |
| Christian (1) Hindu (2) Muslim (3) Jewish (4) Buddhist (5) | | | | |

| DEMETH Which best describes your ethnicity (select the response that best applies) |
|--|
| White: English/Welsh/Scottish/Northern Irish/British (1) |
| White: Irish (2) |
| White: Other white background (3) |
| White and Black Caribbean (4) |
| White and Black African (5) |
| White and Asian or White and Asian British (6) |
| Black, African, Caribbean or Black British (12) |
| Asian or Asian British: Indian (7) |
| Asian or Asian British: Pakistani (8) |
| Asian or Asian British: Chinese (10) |
| Asian or Asian British: Other (11) |
| Gypsy or Irish traveller (16) |
| Other (13) |
| O Do not wish to answer (14) |
| O Roma (15) |
| |
| DEMLAN What is your main language |
| English or Welsh (1) |
| O Polish (2) |
| O Punjabi (3) |
| O Urdu (4) |
| O Bengali (5) |
| Other (6) |
| O Do not wish to answer (7) |

| O Under £15,000 (1) |
|-----------------------------|
| ○ £15,000 to £24,999 (2) |
| © £25,000 to £34,999 (3) |
| £35,000 to £44,999 (4) |
| £45,000 to £54,999 (5) |
| £55,000 to £64,999 (6) |
| £65,000 to £99,999 (7) |
| Over £100,000 (8) |
| O Do not wish to answer (9) |
| |
| |

DEMINC What is your total household income in GBP (\pounds) from all sources before tax?

| COV_INTRO We will now ask you some questions about coronavirus (COVID-19) and new COVID-19 vaccines. |
|--|
| COV_INV Have you received an invitation to receive a coronavirus (COVID-19) vaccine? |
| ○ Yes (1) |
| O No (2) |
| O Do not know (3) |
| COV_DOSE Have you had at least one dose of a coronavirus (COVID-19) vaccine? |
| ○ Yes, I have had one dose (1) |
| O Yes, I have had both doses (2) |
| O No (3) |
| COV_DOSE_2 Do you intend on receiving your second dose? |
| ○ Yes, definitely (1) |
| O Unsure, but leaning towards yes (2) |
| O Unsure, but leaning towards no (3) |
| O No, definitely not (4) |
| COV_VAC_1 Do you intend on accepting a coronavirus (COVID-19) vaccine? |
| ○ Yes, definitely (1) |
| O Unsure, but leaning towards yes (3) |
| O Unsure, but leaning towards no (4) |
| O No, definitely not (2) |
| COV_APT Have you booked an appointment to receive a coronavirus (COVID-19) vaccine? |
| ○ Yes (1) |
| O No (2) |

| Yes, definitely (1) | | | | | | |
|--|-----------------------------|------------------------------|-----------------------------------|-----------------------------|-------------------------------|-----------------------|
| O Unsure, but leaning toward | ls yes (2) | | | | | |
| O Unsure, but leaning toward | ls no (3) | | | | | |
| O No, definitely not (4) | | | | | | |
| /AC_PASS | | | | | | |
