Figure S1. Age-adjusted cumulative COVID-19 related mortality during the outcome period (24 January 2020 to 28 February 2021) with bootstrapped 95% confidence intervals by disability status, stratified by age group (30 to 69 years and 70 to 100 years) and sex.

Figure S2. Hazard ratios for COVID-19 related mortality for less-disabled and more-disabled people compared with non-disabled people in people aged 30 to 69 years or 70 to 100 years in 2020, stratified by sex. Results obtained from Cox proportional hazards regression models adjusted for; i) age, ii) plus residence type, iii) plus local authority district, population density, area deprivation, socioeconomic status (excluding NS-SEC as this only applies to people under 75 years), ethnicity, household composition, and occupational exposure, and iv) pre-existing conditions. Error bars represent 95% confidence intervals of the hazard ratios.
