21

22

23

24 Figure S1: Relative abundances of viruses in unenriched samples (except note below) that
 25 significantly changed over time (LME $P_{adj} < 0.05$) colored by WTP. Sample dates run left to
 26 right (oldest to most recent) along the “x” axis. Note, that SARS-CoV-2 was measured and tested
 27 in enriched samples only (LME $P_{adj} < 0.05$).

28

29 Supplemental File SF1: SARS-CoV-2 RT-ddPCR quantification data, county-reported daily
 30 COVID-19 counts, and seven-day rolling averages for each sample.

31

32 Supplemental File SF2: Genomic coverage, breadth, and descriptive statistics of SARS-CoV-2
 33 sequences for each sample.

34

35 Supplemental File SF3: Sequencing depth and Single Nucleotide Variant analyses for SARS-
 36 CoV-2 per sample after masking potentially problematic sites.

37

38 Supplemental File SF4: Sample metatranscriptomic sequencing metadata.
