## A. Model Equations

To model the virus dispersal in the population, we assume that asymptomatic individuals have equal infectiousness compared to symptomatic ones, while pre-symptomatics have reduced infectiousness given by  $\omega$ . To model behaviour, we assume that symptomatic individuals isolate themselves at some degree, reducing their contacts by  $\xi$ , individuals with severe disease have greater isolation  $\xi_{sev}$  due to hospitalization. The daily contacts between each age class is given by the matrix  $\hat{C}$  and the force of infection  $\lambda$  is given below:

$$\begin{aligned} \lambda = \hat{C} &[A + \omega E + (1 - \xi)I + (1 - \xi_{sev})H + \\ &A_v + \omega E_v + (1 - \xi)I_v + (1 - \xi_{sev})H_v + \\ &A_w + \omega E_w + (1 - \xi)I_w + (1 - \xi_{sev})H_w] \end{aligned} \quad (1)$$

Our model does not assume a reduction in infectiousness by vaccination given the lack of data<sup>1</sup>.

<sup>1</sup>We expect that this would not change the results qualitatively.

### Unvaccinated

$$\frac{dS}{dt} = -\beta\lambda \frac{S}{N} - v(t) \frac{S}{S+R} \quad (2a)$$

$$\frac{dE}{dt} = \beta\lambda \frac{S}{N} - \frac{E}{\gamma} \quad (2b)$$

$$\frac{dA}{dt} = \frac{\alpha(1-\sigma)E}{\gamma} - \frac{A}{\nu_i} \quad (2c)$$

$$\frac{dI}{dt} = \frac{(1-\alpha)(1-\sigma)E}{\gamma} - \frac{I}{\nu_i} \quad (2d)$$

$$\frac{dH}{dt} = \frac{\sigma E}{\gamma} - \frac{H}{\nu_s} \quad (2e)$$

$$\frac{dR}{dt} = \frac{A}{\nu_i} + \frac{I}{\nu_i} + \frac{(1-\mu)H}{\nu_s} - v(t) \frac{R}{S+R} \quad (2f)$$

$$\frac{dD}{dt} = \frac{\mu H}{\nu_s} \quad (2g)$$

### Vaccinated once

$$\frac{dS_v}{dt} = -\beta_v \lambda \frac{S_v}{N} + v(t) \frac{S}{S+R} - (1-\theta)v(t-a) \frac{S(t-a)}{S(t-a)+R(t-a)} \quad (2h)$$

$$\frac{dE_v}{dt} = \beta_v \lambda \frac{S_v}{N} - \frac{E_v}{\gamma} \quad (2i)$$

$$\frac{dA_v}{dt} = \frac{\alpha_v(1-\sigma_v)E_v}{\gamma} - \frac{A_v}{\nu_i} \quad (2j)$$

$$\frac{dI_v}{dt} = \frac{(1-\alpha_v)(1-\sigma_v)E_v}{\gamma} - \frac{I_v}{\nu_i} \quad (2k)$$

$$\frac{dH_v}{dt} = \frac{\sigma_v E_v}{\gamma} - \frac{H_v}{\nu_s} \quad (2l)$$

$$\frac{dR_v}{dt} = \frac{A_v}{\nu_i} + \frac{I_v}{\nu_i} + \frac{(1-\mu_v)H_v}{\nu_s} + v(t) \frac{R}{S+R} - (1-\theta)v(t-a) \frac{R(t-a)}{S(t-a)+R(t-a)} \quad (2m)$$

$$\frac{dD_v}{dt} = \frac{\mu_v H_v}{\nu_s} \quad (2n)$$

### Vaccinated twice

$$\frac{dS_w}{dt} = -\beta_w \lambda \frac{S_w}{N} + (1-\theta)v(t-a) \frac{S(t-a)}{S(t-a)+R(t-a)} \quad (2o)$$

$$\frac{dE_w}{dt} = \beta_w \lambda \frac{S_w}{N} - \frac{E_w}{\gamma} \quad (2p)$$

$$\frac{dA_w}{dt} = \frac{\alpha_w(1-\sigma_w)E_w}{\gamma} - \frac{A_w}{\nu_i} \quad (2q)$$

$$\frac{dI_w}{dt} = \frac{(1-\alpha_w)(1-\sigma_w)E_w}{\gamma} - \frac{I_w}{\nu_i} \quad (2r)$$

$$\frac{dH_w}{dt} = \frac{\sigma_w E_w}{\gamma} - \frac{H_w}{\nu_s} \quad (2s)$$

$$\frac{dR_w}{dt} = \frac{A_w}{\nu_i} + \frac{I_w}{\nu_i} + \frac{(1-\mu_w)H_w}{\nu_s} + (1-\theta)v(t-a) \frac{R(t-a)}{S(t-a)+R(t-a)} \quad (2t)$$

$$\frac{dD_w}{dt} = \frac{\mu_w H_w}{\nu_s} \quad (2u)$$

The equations were numerically solved by the R package developed by FitzJohn and Hinsley [2].

### B. Parameterization of the model

The parameters that do not depend on vaccination are given in Table I.

**TABLE I:** Epidemiological parameters

Parameter	Description	Value	Source
$\gamma$	Average time in days between being infected and developing symptoms	5.8	Wei et al. [8]
$\nu_i$	Average time in days between being infectious and recovering for asymptomatic and mild cases	9.0	Cevik et al. [1]
$\nu_s$	Average time between being infectious and recovering/dying for severe cases	8.4	SIVEP-Gripe for São Paulo State [3]
$\xi$	Reduction on the exposure of symptomatic cases (due to symptoms/quarantining)	0.1	Assumed
$\xi_{sev}$	Reduction on the exposure of severe cases (due to hospitalization)	0.9	Assumed
$\omega$	Relative infectiousness of pre-symptomatic individuals	1.0	Assumed
$\alpha$	Proportion of asymptomatic cases	[0.67,0.44,0.31]	Juvenile [6] Adult and Elderly [7]
$\sigma$	Proportion of infectious cases that require hospitalization	[0.001, 0.014, 0.099]	Salje et al. [5]
$\mu$	In-hospital mortality ratio	[0.417,0.188,0.754]	Portella et al. [4]
