Supplementary Methods

Assessment of diet

Dietary data were obtained from the touchscreen questionnaire at the baseline and the MRI scan appointment. Participants were asked about their frequency of intake of a range of common food and drink items [UK Biobank Category ID: 100052]. The questionnaires were described as below.

Cereal intake was obtained from the touchscreen questionnaire. Participants were asked, "How many bowls of cereal do you eat a week?" Either answer < 0 or > 99 was then rejected. If answer > 14 , then the participant was asked to confirm. Participants who indicated that they ate cereal at least one bowl of cereal each week were further asked, "What type of cereal do you mainly eat?"

The answers included Bran cereal (e.g., All Bran, Branflakes), Biscuit cereal (e.g., Weetabix), Oat cereal (e.g., Ready Brek, porridge), Muesli, and Other (e.g., Cornflakes, Frosties). For coffee intake, participants were asked, "How many cups of coffee do you drink each day? (Include decaffeinated coffee)". Participants who indicated that they drank at least one glass of coffee each day were further asked, "What type of coffee do you usually drink?" The answers included

Decaffeinated coffee (any type), Instant coffee, Ground coffee (including espresso, filter, etc.), Other types of coffee. Participants were asked, "How many glasses of water do you drink a day?" for water intake. For tea intake, participants were asked, "How many cups of tea do you drink each day? (Include black and green tea)". Cooked vegetable intake was obtained from the question, "On

average how many heaped tablespoons of cooked vegetables would you eat per day? (Do not include potatoes)". Salad / raw vegetable intake assessed using the following question "On average, how many heaped tablespoons of salad or raw vegetables would you eat per day? (Include lettuce, tomato in sandwiches)". Fresh fruit intake was obtained from the question "About how many

pieces of fresh fruit would you eat per day? (Count one apple, one banana, ten grapes, etc. as one piece)". Dried fruit intake was obtained from the question "About how many pieces of dried fruit would you eat per day? (Count one prune, one dried apricot, ten raisins as one piece)". Bread intake was obtained from the question, "How many slices of bread do you eat each week?". For food and drink items above, the answer "less than one" was set to 0.5. Participants were asked about their intake frequency of oil fish/ non-oily fish, processed meat, poultry, beef lamb/mutton, pork, cheese, which was reported as "never", "less than once a week", "once a week", "2-4 times a week", "5-6 times a week", and "Once or more daily" and coded from 0 to 5.

In this study, we excluded individuals beyond four times the standard deviation from the mean for each kind of diet phenotype.

Assessment of physical activity

We used self-reported physical activity measured using a modified version of the International Physical Activity Questionnaire (IPAQ), which assessed total physical activity (TPA), including walking, moderate, and vigorous activity undertaken over the last seven days. MET (Metabolic Equivalent Task) scores data were derived based on IPAQ (International Physical Activity Questionnaire) guidelines. Detailed information referred to the website (<http://biobank.ndph.ox.ac.uk/showcase/label.cgi?id=54>). We used total Metabolic Equivalent Task (MET) minutes per week for all activity, including walking, moderate, and vigorous activity. Usual walking pace was characterized as "slow pace", "steady average pace", "brisk pace", and coded to 1 to 3. To assess the time spent watching television, participants were asked, "In a typical day, how many hours do you spend watching TV?"

Assessment of sleep

Sleep duration was recorded as the number of reported hours to the following question "About how many hours sleep do you get in every 24 hours? (please include naps)". Participants were asked "on an average day, how easy do you find getting up in the morning?" with four responses provided ("not at all easy", "not very easy", "fairly easy", "very easy") and coded to 1 to 4. Participants were asked, "Do you consider yourself to be..." to assess morningness or eveningness (chronotype). Four options were provided under this question: "definitely a 'morning' person", "more a 'morning' than 'evening' person", "more an 'evening' than 'morning' person", "definitely an 'evening' person" and coded 1 to 4. To assess insomnia symptoms, participants were asked, "Do you have trouble falling asleep at night, or do you wake up in the middle of the night?" with three options "never/rarely", "sometimes", and "usually" and codes 1,2,3. Participants were asked, "Do you have a nap during the day?" with the same responses to insomnia symptoms. Finally, daytime dozing/sleeping (narcolepsy) was coded based on answers to the following question: "How likely are you to doze off or fall asleep during the daytime when you don't mean to", with the following options: "never/rarely", "sometimes", "often", "all of the time", coded to 0 to 3.

Assessment of smoking

Smoking data were obtained from the touchscreen questionnaire at the baseline appointment. Participants were asked about their smoking history [UK Biobank Field ID: 20160]. The number of cigarettes currently smoked daily (current cigarette smokers) was acquired from the question "About how many cigarettes do you smoke on average each day?".

Assessment of alcohol intake

Alcohol intake data were obtained from the touchscreen questionnaire at the baseline appointment. Participants were asked about their alcohol intake frequency [UK Biobank Field ID: 1558] was reported as "never", "special occasions only", "one to three times a month", "once or twice a week",

"three or four times a week", and "daily or almost daily" and coded from 0 to 5. Average weekly alcohol consumption of a range of drink types: red wine, champagne /white wine, beer/cider, spirits, and fortified wine were collected from participants who indicated they drink alcohol more often than once or twice a week. The measurement units for each of the five alcoholic drink types: 5 measures for spirits, glasses for wines, and pints for beer/cider, which were estimated to be equivalent to 1, 2, and 2.5 units, respectively. Individuals reporting current intake frequency of "one to three times a month", "special occasions only" or "never" (for whom this phenotype was not collected), were assumed to have a weekly alcohol consumption volume of 0. From these measures, we calculated an average intake of alcoholic units per week, derived by combining the 10 self-reported estimated intakes of the different alcoholic beverage consumptions across the five drink types, as in a previous study¹.

Assessment of cognitive function

Fluid intelligence score was obtained from a simple unweighted sum of the number of correct answers given to the 13 fluid intelligence questions. Participants who did not answer all of the 15 questions within the allotted two min limit are scored as zero for each of the unattempted questions.

Reaction time: First, the participants were presented with 2 cards in the middle of the screen. Second, the participants were asked to press the button box as soon as possible when two cards matched. The variable was the mean duration (milliseconds) to the first press of snap-button summed over rounds in which both cards matched.

20 Numeric memory: Firstly, the participants were presented with a string of numbers on the screen, which subsequently disappeared. Secondly, the participants were asked to enter the number in reverse order. If the answer was correct, there would be a longer number on the screen to remember. The test would end when two mistakes are made or five successive incorrect responses at string

length = 2. The variable was maximum string length recalled correctly (range: 0-12), with higher scores indicating better performance.

Pairs matching: Firstly, participants were shown six card-pairs of symbols randomly scrambled on screen. Secondly, cards will then turn face down on the screen, and the participants were asked to
5 select the pairs by touching the screen. As pairs were found correctly, the cards will disappear. The variable was the number of errors made during pairs matching (range 0-146).

Prospective memory: In this test, the participants were asked to remember to carry out a pre-planned instruction after a filled interval. First, at the beginning of the test, they were shown the following instruction: "At the end of the games, we will show you four colored symbols and ask
10 you to touch the blue square. However, to test your memory, we want you to actually touch the orange circle instead." The variable was whether or not the participants remembered to touch the orange circle on the first attempt.

Matrix pattern completion: First, the participants were shown a series of matrix pattern blocks with missing elements. Second, the participants were asked to choose the element that could best
15 complete the pattern from a series of given choices. The variable was the number of puzzles for which the participant gave the correct solution.

Symbol digit substitution: First, the participants were shown a grid linking symbols to a single integer, and another grid containing only symbols. Second, the participants were required to use the symbol-integer pair in the first grid as a key to indicate the number attached to each symbol in
20 the second grid. The variable is the number of symbols correctly matched to digits by the participants.

Tower rearranging: First, the participants were shown illustrations of three piles (towers) on which three iron rings of different colors were placed. Second, the participants were asked to indicate how many steps it takes to rearrange the hoop to another specific position. The variable was the number of puzzles correctly answered.

5 Trail making: First, the participants were shown 25 circles distributed on the screen, which contained 1-25 numbers (digital trails) or a mixture of numbers and letters (alphanumeric trails). Second, the participants are required to connect the circle from the smallest number to the largest number in one task (number tracking), or alternate between numbers and letters in ascending alphabetical order in another task (alphanumeric tracking). The variable was the duration
10 (deciseconds) to complete the trail. Please note that we reverse the sign of the variable to ensure that the higher the score, the better the performance.

Structural MRI

Structural MRIs were collected across three imaging centers that were equipped with identical scanners (Siemens Skyra 3T running VD13A SP4 with a Siemens 32-channel RF receive head coil,
15 Munich, Germany). For each scan, Siemens auto-align software determined the field-of-view, which aligns a scout scan to an atlas. If auto-align failed, the radiographer set the alignment. Structural images were acquired with straight sagittal orientation (i.e., with the field of view aligned to the scanner axes), with a resolution of $1 \times 1 \times 1$ mm and a field of view of $208 \times 256 \times$
20 256 matrix, over a duration of 5 minutes, and with 1-mm isotropic resolution using a 3-dimensional magnetization-prepared rapid-acquisition gradient echo. The MRI protocols have been described in detail elsewhere².

Genetic Data

Genotype data are available for all 500,000 participants in the UKB cohort. All blood samples were genotyped using the UK BiLEVE array and the UK Biobank axion array. The two single nucleotide polymorphism (SNP) arrays are very similar, with over 95% common marker content. Quality control was performed by Affymetrix, the Wellcome Trust Centre for Human Genetics, and by the present authors; this included removal of participants based on missingness, relatedness, gender mismatch, non-British ancestry and other criteria, details of the array design, genotyping, quality control and imputation are available in a previous publication³.

Supplementary Figure

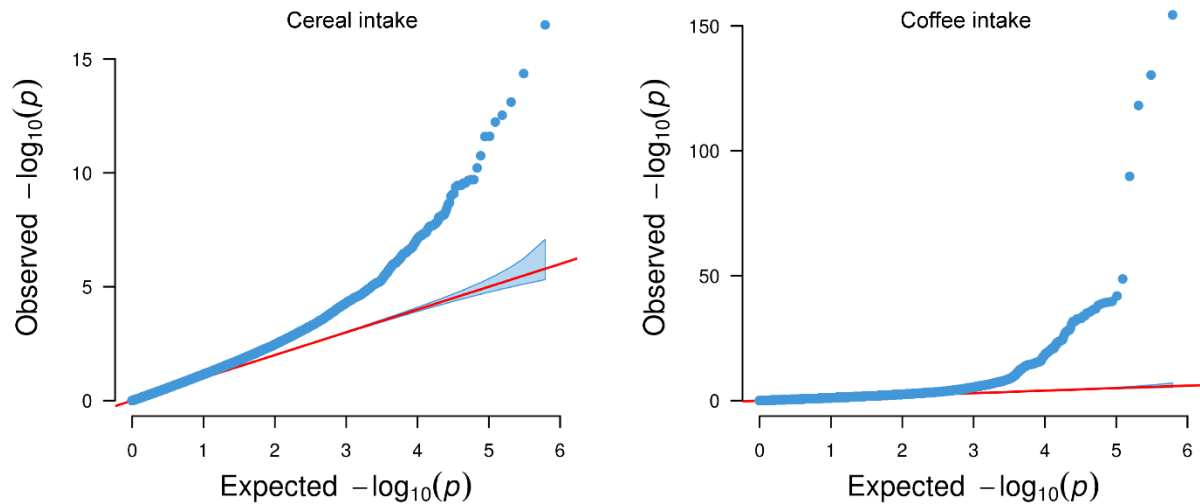

Fig. S1. QQ-plots for the genome-wide association studies of cereal intake (left) and coffee intake (right). Inflations of the QQ-plots were not due to population stratification, with intercepts from LD regression estimated as 1.013 (cereal intake) and 1.005 (coffee intake).
