Fig S1. Gene expression levels across CKD molecular categories and healthy controls

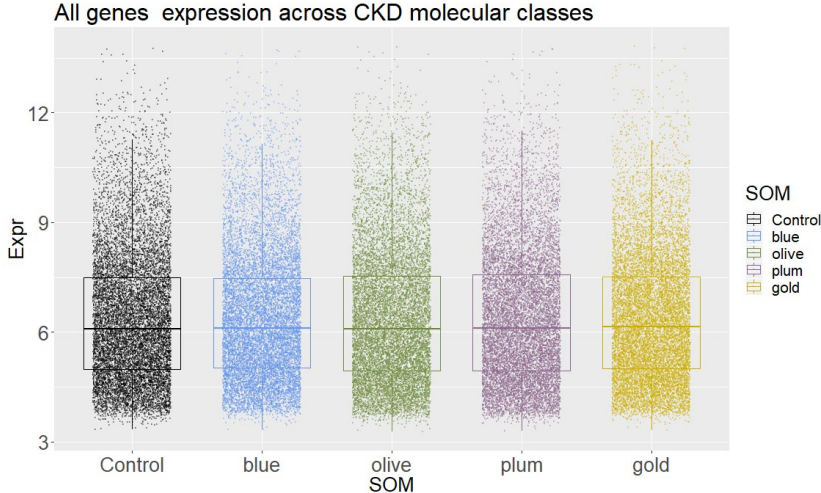

Fig S2. eGFR by molecular category stratified by CKD stage

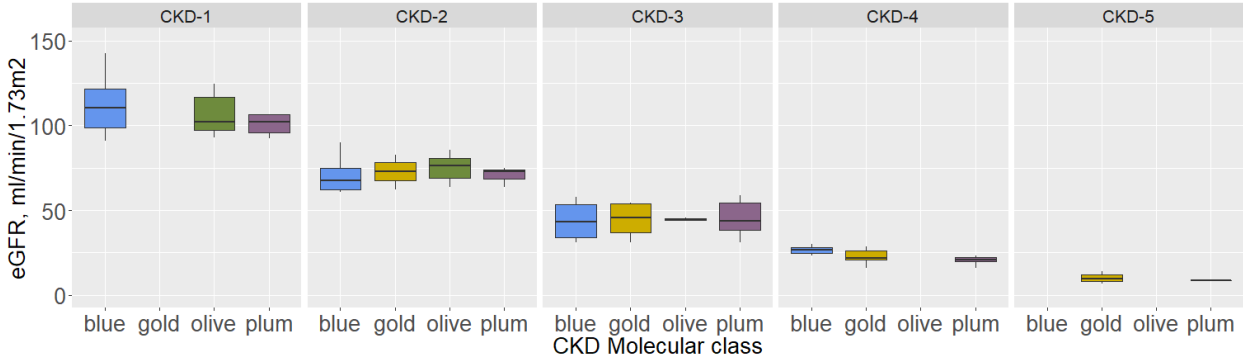

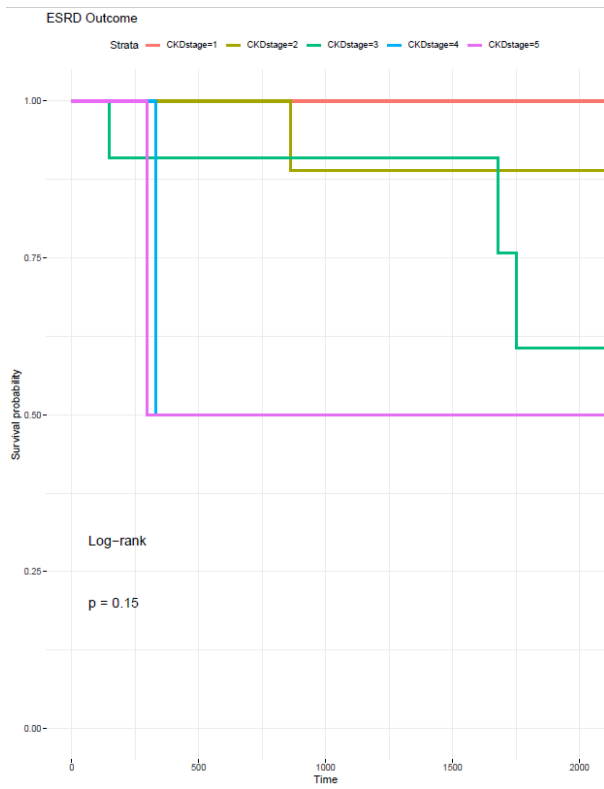

Fig S3. Kaplan-Meier survival curves for prediction of ESKD outcome stratified by (A) CKD stage (C-PROBE) and (B) histopathological diagnosis (NEPTUNE)

A.

B.

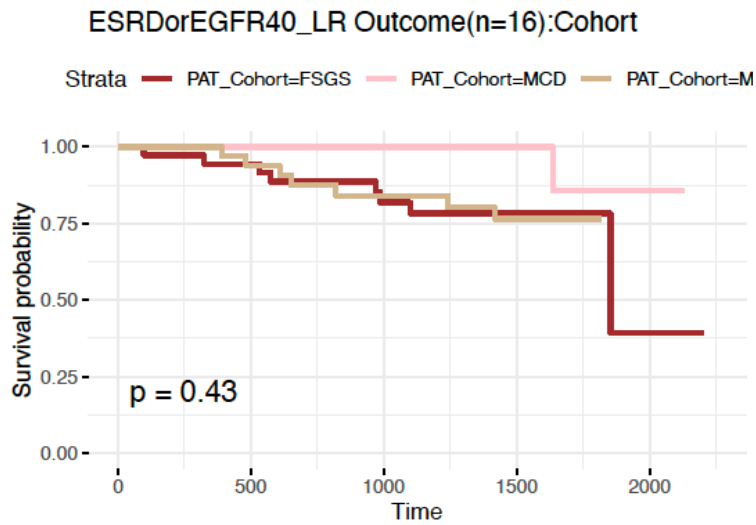

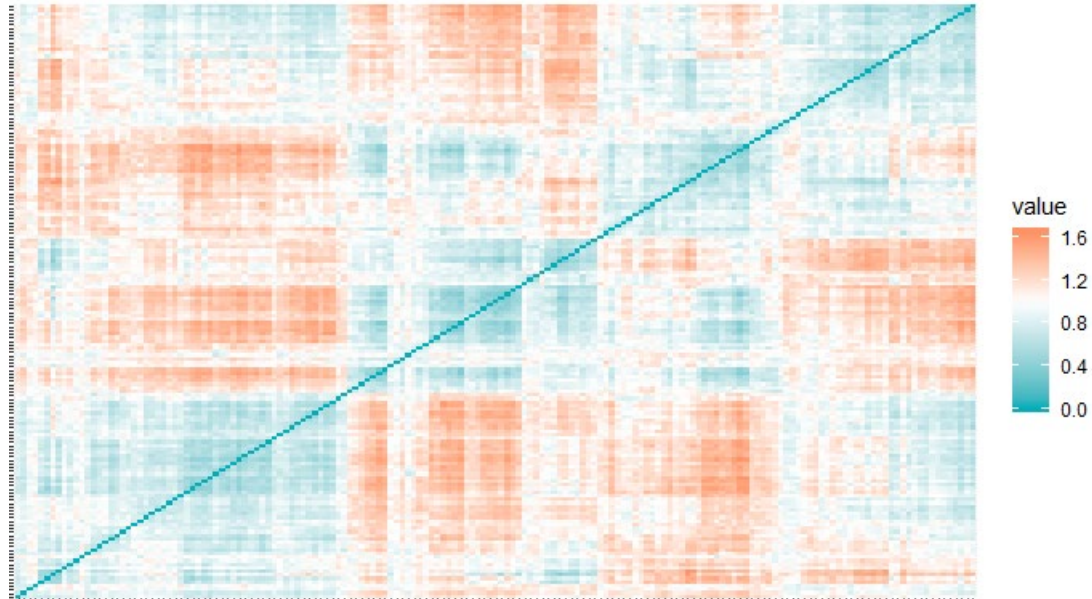

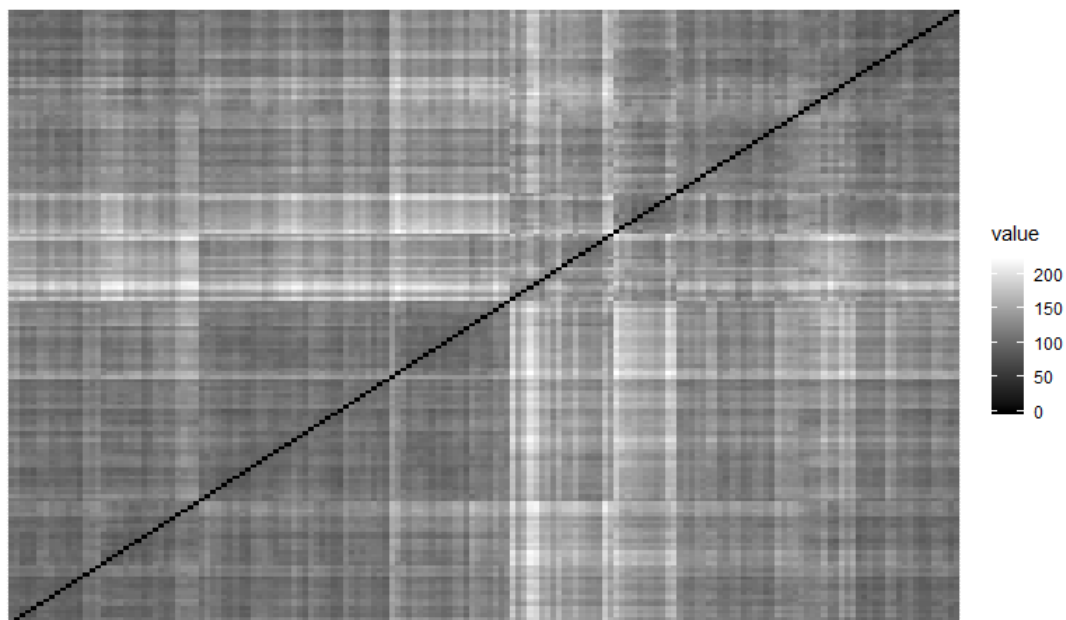

Fig S4. Data clustering tendency assessment

(A) Pairwise Spearman correlation-based distances between samples to assess similarity between observations. (B) VAT (Visual Assessment of cluster Tendency). The value of Hopkins statistic is below 0.5, implying that the dataset is significantly clusterable, that is, contains inherent grouping structure.

A.

B.

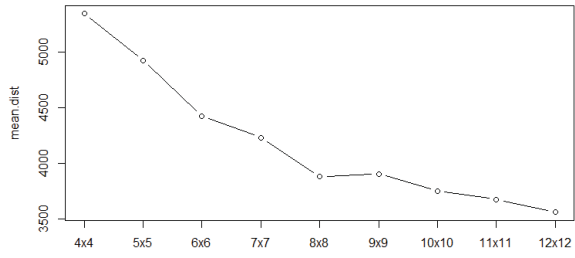

```

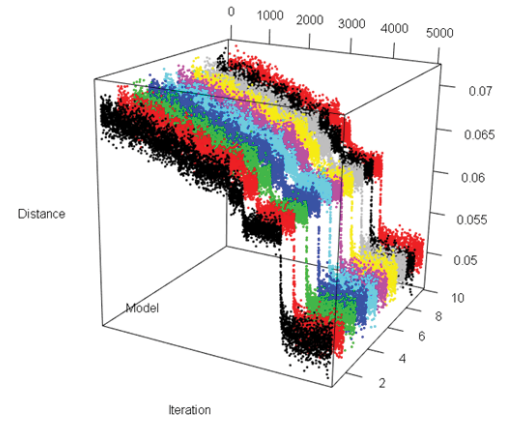

Fig S5. Building Self-Organizing Map of CKD population

- (A) SOM mapping quality, estimated by the average distance of each data point to its corresponding codebook vector (BMU), plotted as a function of map grid size. Is a measure of map resolution. 8x8 grid is the simplest model achieving the best mapping.
- (B) Convergence as a linear combination of the two SOM quality indices, embedding accuracy and estimated topographic accuracy, was evaluated across various N iterations and reached 0.8 at 50,000. The embedding accuracy (black line) is the variance of the training data captured by the map. Evaluated by Kolmogorov-Smirnov test. Grows with the number of iterations, acceptable at 50,000. Topographic accuracy (blue line) is the proportion of data points for which first and second BMUs are adjacent units. Measures topology preservation. Is perfect already at 1,000 iterations.
- (C) Learning progress is similar across 10 independent models. Considering the random nature of SOM initialization, behaviors of SOMs from 10 independent runs were compared. The results and conclusions were not materially different.

A. Quantization error vs map size

C. Learning progress across 10 independent models

B. Convergence vs N iterations

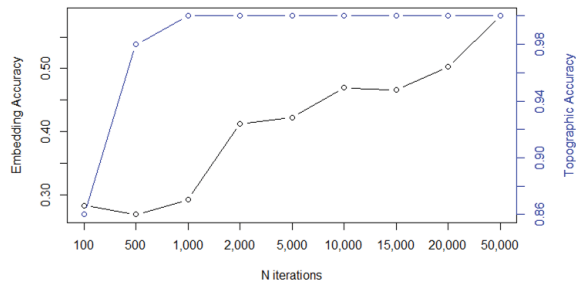

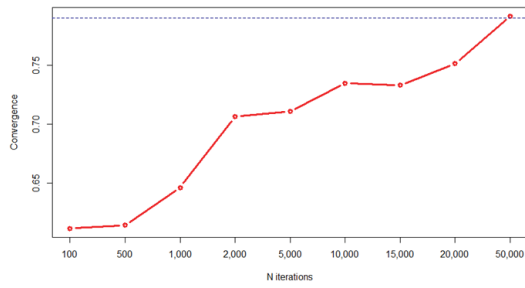

Fig S6. Final model SOM properties

(A) Diagnostic counts plots; (B) mapping quality; (C) neighbor distances; (D) number of clusters. (E) The simplest model with the lowest within-cluster sum-of-squares is selected.
